Thread: [How to automaticly download files and download passwords when slaves connect?](#)

**Holt** - June 9, 2014, 4:39 pm

Is there a way to automatically download a file to a slave when it connects and download the stored passwords?

**Betty Blue** - June 9, 2014, 4:51 pm

Why would you download the file when you can use the password recovery on darkcomet? Stop making threads about questions asked in your other threads.

because if i am not there to see the passwords then they can be downloaded so i can see them later.

But to put the file on their computer wouldn't you need to be on your computer to put the file on their computer? I'm sure it is possible to write something that does that for you while you are away, but if you don't know how I don't think someone is going to just make it for you. You might as well just wait until you are oth on and use the password recovery. Much easier.

I suggest just installing a keylogger on their PC and having access to every single key stroke they make, and about downloading files to their PC, why don't you just use the execute command on DarkComet?

I think he is saying he wants it to upload as soon as they connect to DC without him having to click anything.

It would take too long to analyze passwords.

Darkcomet has a feature that allows you view keylogger databases. As long as the victim types the password, you can always check it from there.

I also believe there is a section where you can view the saved passwords on that computer. Such as email, social media, and just general log in accounts. Although I am not for sure about that because I haven't used Dark Comet in ages. Anyway.. best of luck OP. Regards, ?

I believe OP wants a script that will automatically run once the slave executes his virus. This script would automatically send OP the slave's passwords without him having to do it manually.

OP : The only way I see this possibly, is if you add to the DarkComet stub with the script. And by doing this, you may corrupt the stub itself. Alternatively, you can manually use file sender / receiver to send the script to your slave. Then you would have to execute it through one of the batch files. However, it seems like it would be easier to simply manually get the passwords through DC's password stealing / keylogger.

Hope this helps,

-Ney
