Thread: [Burning ISO to a USB?](#)

Makaveli. - June 20, 2014, 6:41 am

So I'm currently at Dad's work and one of the computers are fucked, I know there's a program that lets you 'burn' ISO's to a USB, so I can do another install of Windows, but I'm just wondering if the USB will be useable after I've burnt it? Maybe a stupid question but hey ho, thanks.

Rufus <http://rufus.akeo.ie/>

of-course it will still be usable you can just reformat it.

It will be usable, just format the USB after.

Personally I like YUMI : <http://www.pendrivelinux.com/yumi-multiboot-usb-creator/>

It never fails and is really efficient.

For interest's sake, if you are looking for a simpler program, you can use [WiNToBootic](#). Just drag and drop.

Looks like a bad link. The website was blocked by Malwarebytes and doing a bit of research it seems malwarebytes [has confirmed it's not a false positive](#). Also found this:

Just format the USB, and you'll be fine.

My friend burned a WinXP ISO onto his drive using PowerISO, but he fucked up and installed a Spanish version. He tried changing the language, but that didn't work.

Don't mess up like he did, OP.

He fucked up by downloading a torrented copy of Windows XP right away.

There's no official Windows XP .iso on the web.

MBAM being an anti-malware uses different heuristics to target malwares unlike anti-virus and it is necessary should you visit too many shady sites. If my research is correct, the IP was exploited before and maybe was blacklisted then. The tool itself is clean as I have used it many times while assisting un-bootable OPs or installing OS in my machine if DVDs are unavailable. ?

Arnette Rene - June 20, 2014, 11:50 am

Something called unetbootin works like a charm. you should try that OP!

I was about to say the same thing! It's free, cross platform and open source, you can find it [here](#).

UNetBootin actually have issues with Windows 7 .iso for some reason. Better off using YUMI, Windows 7 USB DVD Download Tool, etc.

Yeah I prefer using the AIK for windows. Works perfectly with every linux distro there is though!

DeplorSocio - June 20, 2014, 12:16 pm

Don't use ANY of the crap listed above. UNetBootin is the best, most reliable program out there. I'm not kidding. I work with so many copies of Linux on external drives.. it works great.

For GNU/Linux distro, nothing to say about it, works flawlessly ?

I'll still stick to YUMI. Since Poly told me about it, I feel in love with it haha !

UNetBootin was listed above, so you are technically calling it crap.

Never heard of it, I'll have to try it out sometime!

I love how you call the other programs/tools listed crap and you probably never used them before ... lol.

Also, "I'm not kidding, I used it so many times and it works with SO many copies of any distros, OS, etc. there is ... it works great". Same argument I could use for YUMI. So what's your point ?

I've literally used every single program above us. Don't assume. My point is, it's honestly the fastest one. Do you have a problem with me, or the program I listed? If not, then what's your problem?

I have a problem with yourself calling all the other programs "shit" when they are not. YUMI is as good as Unetbootin. And YUMI is also as fast as Unetbootin, so once again, what's your point ?

And like I stated, Unetbootin have issues with Windows .iso, which is the .iso the OP wants to use in this case, therefore YUMI would be a better pick in this situation.

I said crap, not sh*t, don't shove words down my throat.

to OP:

Hope you figured this out, update us.

Crap and shit is most likely the same thing for me, a non-native English speaker.

As a native English speaker, they are synonyms, meaning they can be used interchangeably.

Yes, you can format the USB after installing the .iso

But there are no official Windows XP .iso's on the web, apart from if you're using a disk to extract it's ISO to the USB.

Niely - June 21, 2014, 2:38 am

I use Rufus: <http://rufus.akeo.ie/>

Easy and it seems to work. :)
