It is most likely due to the user you are trying to resolve is blacklisted by the API itself. Since I did not make these API's, I can't control everyone that is blacklisted, only the people that are on my website.

I am getting a SpeedResolve API soon so that may solve the issue.

Most likely you are blacklisted on the API itself and not my resolver. If you were blacklisted on my resolver, you would get an error message saying the user is blacklisted.

I am getting my own API soon so nobody but people who have purchased blacklist will be blacklisted.

Service works great however the captcha has some resizing issues when you go to resize the window the captcha does not follow the same size proportions. Im not a great web developer but im

not sure of a way to fix that.

You could try to create a popup when the user attempts so submit the username with a popup with the captcha on it.

We have a credit system ready, it should be out soon.

API and resolver has been updated. The credit system is finished, but there is no set release date due to some life issues. kResolver will remain up and working.

Kasual™ - September 2, 2014, 7:36 am

Marketplace Updated! Credit System for API is out. Starting at \$7.50! <http://skypeip.net>
