Thread: [VPN + Tor Full Anonymity Theory](#)

metalmaniac253 - June 29, 2014, 9:00 am

Okay, so everybody is looking for the most anonymous VPN they can get their hands on. I have a theory, but I need somebody who has a VPN that can forward ports to test it. (I will be financially unable to test for a few weeks) You can use Open VPN to connect to a VPN server through a proxy, however if you connect through a proxy will your server or whatever service you needed to forward a port for still be accessible from the internet?

If this is possible then you could get a VPN that (Supposedly) does not keep any logs. You can then use a chain of proxies or TOR to connect to the VPN and in theory have a higher degree of anonymity. The only possible issue is that a service run through a forwarded port may or may not work. Has anyone tried this or currently have the tools to test it?

Here's the thing this has been a theory for a while, people speculate that the FBI has a way to bypass Tor Nodes. I personally use my own I run > Sock5 > Tor for normal use, but when I am doing other I sometimes run Sock5 > Virtual Machine > VPN > Tor > Sock5.
