Thread: [Color 'shading' with Photoshop?](#)

**Dennse** - July 1, 2014, 4:47 pm

Hi HF!

I'm trying to create something like this in Photoshop:

I'm interested in knowing how I can create the different shades of the given color when drawing, without having to change the color to something lighter/darker for every 4th pixel like on the picture.

I don't know if I'm clear enough, but I hope you can help me.

Thanks in advance.

Use a brush with hardness 0% (not a pencil)

**Dennse** - July 1, 2014, 5:30 pm

It's not exactly what I'm going for.

Here's a place where you can see exactly what I'm looking for: <http://www.needcoolshoes.com/>

1. Click Paint Tool
2. Click 'Add a 'camo' effect to the stroke'
3. Draw something

One thing you can do is add noise then blur it. Filter>Noise>Then add some noise and use hue and saturation on it until it looks good. Then you could use a small gaussian blur and expand the image out and cut it to a square and such to make the fades go away. Only thing I can think of off the top of my head.

colour all your colours on a layer then put it invis and only refer to it as your colour pallet

edit: don't colour over eachother lol
