Thread: [Prevent browsers from Leaking system information ?](#)

PoLoW - July 3, 2014, 8:47 pm

Hi ,

I'm looking for a method or a Trick to generate FAKE system information everytime i fire Any web browser "Chrome,Firefox" for example .

The Leaked information such an OS name\version , Flash Version, Screen resolution, Browser version etc ...

I need a method that makes the browser generate any fake data to be complete hidden while clicking ads and doing other stuff .

hope i get an answer to this :) tnx

One way of doing this is using a virtual machine with completely fake information inputted into it. Other than that, there is no other way that I know of doing this.

Fake username, computer name, use a bridged connection on it, (configurable easily in the VM's settings) and use a VPN.

It would totally throw any web browser off 100%.

I thought about Virtual machines but i will need more than 3 OS installed on each VM to fake the OS version Only , i couldn't find a browser that is capable to do what I'm looking for yet .

Try going on google and searching up "user agent faker [web browser]" and you should get plenty of results from addons to do this.
