Thread: [\[help\] i attacked a shared hosting website, what next](#)

vmaster - July 14, 2014, 7:17 pm

I tried to hack a website and upload successfully a shell there. I intend to local another website, but I cant as the permission. What can I do next from the uploaded shell?

Server: Windows server 2003, iis 6.0, MS Access Database, ASP.

Thanks

Can someone give me a hand? I can share the target after that. I am learning the hacking.

You can try to get root via local root exploit, or create symlinks to files on the target website.

I don't think a local root exploit will get him far on a Windows server.

~Arcane ?

well, you've hacked in, next step would be... going to jail.

hacking is illegal.

I think you forgot the part where nobody cares. If they did, they wouldn't be posting here.
