Thread: [HELP ME PLZ](#)

lebanese - July 23, 2014, 1:01 am

i made sure my port was listing on darkcomet (1604) BUT when i make my stub and i make sure i have the right stuff in the networks tab (my host and port) i create the stub BUT then when i open it (to test) it WONT WORK! nothing happens anyone have an idea why? i want to point out that when i make a stub without the NO-IP DUC thing and only with the default one (127.0.0.1) it works only on MY PC cuz i uploaded it to media fire with the 127.0.0.1 to test on my bros pc it dosent work.

so what im pointing out here is my stubs wont work with the no ip duc thing anyone know why??

another thing if i use the default ip (127.0.0.1) it WORKS ONLY ON MY PC

and for the no ip when i open the stub to test nothing happens but i know its running cuz when i try to delete it i have to end its process first (via task manager)

PLZ HELP

G3TRoot - July 23, 2014, 2:36 am

Are you using minimalist on dark comet? I had the same problems also when I started localhost worked but my no ip would not work on myself. A memeber on hackforums helped me out if you want i could give you some help later. I will be online in about 2 hours if you want some help i could help you through team viewer.

lebanese - July 23, 2014, 2:50 am

nah man im using expert and im gonna sleep soon as its 5:49am here lol and ill be glad if you helped me but i might sleep soon

WOULD LOVE HELP FROM OTHERS TO!!!!!!

cyb3rzone - July 23, 2014, 3:16 am

hey bro i m providing rat setup service with 20 slaves for just 5\$ if you want give me your skype id

lebanese - July 23, 2014, 3:19 am

its ok man im good im not a noob just stuck with a little problem hoping someone can help fix

STILL NEED HELP PLZ

G3TRoot - July 23, 2014, 4:19 am

(Jul 23, 2014 03:19 AM)lebanese Wrote: [\[CITE\]](#) its ok man im good im not a noob just stuck with a little problem hoping someone can help fix

STILL NEED HELP PLZ

Hey I'm back on if you still need help bro.

If you have skype post it below and i will help you on teamviewer.

lebanese - July 23, 2014, 11:29 am

nah man i dont have skype is team viewer safe? and im gonna be gone till about 10pm est

can someone plz help

Oliver Sykes - July 25, 2014, 12:43 am

Setup a DNS at freedns.afraid.org and use that in place of the no-ip. Then download the wget script, or open the direct url updater every time you restart the pc or router.

lebanese - July 25, 2014, 1:13 am

i get the error ERROR: Address (my ip) xx.xxx.xxx.xx has not changed

i have tried doing it still not working :(any other suggestions?? i tried disabling my firewall still no work i can open my stub but in the bottom right corner nothing appears

also tried re-opening my ports still not working i can see my port is open on "canyouseeme.org"

I NEED HELP PLZ

Oliver Sykes - July 25, 2014, 1:20 am

That means the DNS is set to your ip already. Have you crypted it? It could be that a crypter corrupted your stub.

lebanese - July 25, 2014, 1:23 am

i crypted A stub with aegis cryptor (cuz it was free) BUT that was like 10 stub tests ago i also deleted the cryptor and re installed darkcomet

The_Predator75 - July 25, 2014, 1:43 pm

I can see that you have mostly setup correctly in that you have setup DC to listen on port 1604 which is fine. I can also see that when you tested the stub on your own computer using the ip 127.0.0.1 and it worked but not when you used the ip 127.0.0.1 on your bros pc.

I can understand your problem, the ip 127.0.0.1 (as you may already know) means "localhost" (which is your own computer). By placing this as the ip for the server to connect to, on your own computer is fine because it will connect to the "localhost" which is your own computer and also where you are running the DC client but if you use 127.0.0.1 for the server on your bros pc, the server will send the packets to his own pc, instead of your own where the DC client is located.

So, basically, if your bros pc is on the same network as your own then, in the servers ip connection you will want to put your ipv4 address. To find this you will want to open up a command prompt and type "ipconfig" then find your ipv4 address which will normally be near the top. Then you will want to use this as the servers connection point with the port 1604 (the one that DC is listening to)

As a result, if your bros pc is on the same network as your own, and you have used your ipv4 address instead of 127.0.0.1, your new slave should connect. In terms of No-IP, while your are just connecting to pc's on your own network, this is not necessary.

I hope that this solves your issue and feel free to reply if you have any queries and I will try to help you.

P.S. sorry about any minor grammar mistakes, it is because it is quite late where I am.

lebanese - July 25, 2014, 1:46 pm

its alright lol your the first with a decent reply! thanks but i only use localhost on my pc which did work fine now im hearing no ip duc is bad so i deleted it and went to freedns.afraid and put that in the networks tab of my stub and i went to test it on my bros pc with no localhost just my dns and it sadly still didnt work this is so weird plz help and your saying if i put my ipv4 adress in my network thing in darkcomet it will work for my bros pc? but what about if i want to spread it on the internet and they are not connected to my network? im usually quite good at this but this problem got me good

and just to make sure when i port forward i put my ipv4 adress in local ip. BUT that address ALWAYS changes so i have to keep going back on the router and even sometimes when everything looks good i have to go back in to the router delete my forwarded port and restart because canyouseeme.org says connection refused

so if i use my stub with my dns on lets say mt friends pc on a diffrent network it should work but if im home only use ipv4 address? (like trying to rat my bros)

RustyCl0wn - July 25, 2014, 2:40 pm

Goto whatismyip.com make sure your no-ip address has same ip. Port forward 1605 to your PCs local ip (in command type ipconfig your local address may resemble something like 192.168.1.10). In darkcomet make sure network field has the no-ip address and port is 1605 then do whatever you like for the other settings. Make sure you set your listening port to 1605 aswell.

Just a small note if your trying to use darkcomet through a VPN you need one on which you can port forward and the no-ip will need to be set to vpns's ip

Hope this helps

lebanese - July 25, 2014, 3:11 pm

when i do ipconfig is this the ipv4 i need cuz i have alot of other collums for vmware

Wireless LAN adapter Wi-Fi:

Connection-specific DNS Suffix . :
Link-local IPv6 Address :
IPv4 Address. : this one?
Subnet Mask :
Default Gateway :

and now can u see me.org keeps saying connection refused for port 1604 what shouuld i do? do i need to change ports to 1605?

and yes whats my ip is the same ip as my subdomain dns

RustyCl0wn - July 25, 2014, 3:26 pm

(Jul 25, 2014 03:11 PM)lebanese Wrote: [\[CITE\]](#) when i do ipconfig is this the ipv4 i need cuz i have alot of other collums for vmware

and yes whats my ip is the same ip as my subdomain dns

Yes that one should be your local ip as for port i use 1605 to be different shouldnt matter. Are you currently using a VPN service ?

lebanese - July 25, 2014, 4:03 pm

no im not using a vpn my ports are saying connection refused on canyouseeme.org and my bro just called my isp and they said we are receiving a very small amount of packets on our end and now a technician has to come and fix it on Monday does this have anything to do with port forwarding i dont want to change subjects just wondering... no im not using a vpn service

STILL NEED HELP ANYONE PLZ :)

RustyClown - July 25, 2014, 4:44 pm

Doubt it will be anything you have done. Ok so ruled out vpn have you actually tried infecting yourself with your server file ? (Dont worry you can always uninstall the server via darkcomet or use the darkcomet removal tool on their website). Sometimes can you see me doesnt always show open ports.

lebanese - July 25, 2014, 4:46 pm

yes i have with my localhost ip 127.0.0.1 it works ONLY FOR ME but with my dns it doesnt work

Arcanine - July 25, 2014, 5:02 pm

(Jul 25, 2014 04:46 PM)lebanese Wrote: [\[CITE\]](#) yes i have with my localhost ip 127.0.0.1 it works ONLY FOR ME but with my dns it doesnt work Just pmed you. I can help you over teamviewer if you like.

lebanese - July 25, 2014, 5:06 pm

hey man i dont have skype :(but if u would like you can read over this thread and you can tell me what the problems may be?

Arcanine - July 25, 2014, 5:08 pm

(Jul 25, 2014 05:06 PM)lebanese Wrote: [\[CITE\]](#) hey man i dont have skype :(but if u would like you can read over this thread and you can tell me what the problems may be? Check canyouseeme.org type in 1604 and tell me what it says.

twollybangin - July 25, 2014, 5:10 pm

Dude your using no-ip, don't use freedns.afraid.org. And you cannot connect to your own domain because you can't connect to your external ip and when your trying to see your bro use your private ip not 127.0.0.1 because thats just for testing on yourself.

lebanese - July 25, 2014, 5:14 pm

im useing freedns right now so i cant use my dns on my self or my home network but it will work on public networks like people on the internet? so if i want to connect to my bro i have to use my ipv4 adress and not my dns?

RustyCl0wn - July 25, 2014, 6:26 pm

What ip address have you forwarded 1604 to ?

lebanese - July 25, 2014, 10:17 pm

my local ip address is the one i forward to. ok can someone clarify? so im useing freedns right now and peoplle said that if i want to rat people in my homenetwork like my bro i need to use my local ip (v4) and if i want to rat people on the internet i have to use my freedns???

UPDATE: i didnt have my port listiong on darkcomet just did and i got succes i can see service on xx.xxx.xxx.xxx

NOW I PUT MY IPV4 in the network tab and now im gonna upload it to media fire go to my bros pc and see if you guys were right!

PLZ IF IM DOING STUFF WRONG TELL ME

The Hidden - July 25, 2014, 10:32 pm

lebanese - July 25, 2014, 10:44 pm

OMG guys my stub worked on my bros PC!!!!!! YAAAAAAA

I USED MY LOCAL IP AND IT WORKED!

alright now i need questions awnserd plz?

how come i cant use my dns on my home network?

will my dns and stub work on the internet now?

if someone uninstalls the virus can i still control them or no?

Another question if my internal ip changed do i have to re install my stub on their pc?

if someone turns of their pc do i have to re install the virus or no?

AND GUYS IM NOT DONE I JUST HAVE TO SEE IF MY VIRUS WORKS WITH MY DNS ON A PC NOT IN MY NETWORK ill see if it works if i can find a slave

BlueNotGreen - July 26, 2014, 5:26 am

Ill fix it for you if you add me on skype and download TeamViewer.

Also ill answer all your questions :)!

g0dspeak - July 26, 2014, 6:32 am

Hi!

how come i cant use my dns on my home network?

you cannot connect to your own ip address/dns. You can only connect to yourself via localhost/127.0.0.1. only remote users (NOT ON SAME NETWORK) can connect to your ip/dns.

will my dns and stub work on the internet now?

Yes, other users should be able to connect to your dns/client.

Another question if my internal ip changed do i have to re install my stub on their pc?

your internal ip doesn't change, as it's localhost. your EXTERNAL ip address, (dynamic/changing) if it changes, do not worry about it, because no-ip DUC automatically updates the ip to dns routing change.

if someone turns of their pc do i have to re install the virus or no?

nope! darkcomet should run every time they start their computer.

lebanese - July 26, 2014, 2:42 pm

wow man thanks for that! another question (sorry) when i go to the network tab in darkcomet for my home network do i write 127.0.0.1 OR my ipv4 address to connect to my bros pc cuz i used ipv4

address and it worked!!! does the ipv4 address change? cuz when i portforwarded and needed the local ip it was xxx.xxx.x.14 now its

xxx.xxx.x.12 ????? not just that when it changes i have to RE-forwarded again. And my localhost 127.0.0.1 can i use that on my bros pc cuz it doesnt change? cuz when i created the stub with the ipv4 address and it changes i have to re install the stub on his pc and i cant keep doing that!

AND do you recommend NO IP DUC cuz i deleted and got the freedns.afraid cuz people were saying no ip spys on you what do you recommend? thanks

and is their a way to test my stub for the dns version since i cant open it to see if it works??
THANKS

Oliver Sykes - July 27, 2014, 8:25 am

Your ip address probably changes because you have a dynamic ip.
It's best to use freedns.

Step one:

make an account at freedns.afraid.org

Step Two:

Go to the Dynamic DNS Tab.

Step Three:

Make a Dynamic DNS subdomain.

Step Four:

Put that DNS in the Network settings. For example. HFBlahBlah.strangled.net

Step Five:

Turn on a VPN

Step Six:

Go back to the DNS page on freedns.afraid.org and click Direct URL

Step 7: Crypt the stub and spread!

I hope this helps!

lebanese - July 27, 2014, 1:43 pm

update: got it to work!! scanned it on virus total and it came up in the bottom right of my pc screen now i need to crypt!]

now i need to know when i need to click direct url lol. also if my ip that i portforwarded changes do i have to get my slaves back?

Oliver Sykes - July 29, 2014, 3:04 am

You click it when you turn your Vpn on. If you don't use a vpn, (Which I strongly recommend you do), You'd direct url update whenever you restart your pc, or router. If you do use a vpn, run it when you start the vpn.

lebanese - July 30, 2014, 10:19 pm

alright thanks, if i use a vpn does it mess up my home stub connections (using ipv4 for home) ?

or only my external ip?

Oliver Sykes - July 30, 2014, 11:48 pm

It should not affect any connections if you used your DNS in the stub.

That was a four month old post. He's most likely figured out that he doesn't have nat loopback by now and doesn't need your vpn.
