Thread: [Upload Screenshot to ftp without saving?](#)

Chefhatrulez - July 28, 2014, 9:48 am

Hey,

I'm currently creating a screenshot tool that uploads screens to a ftp server (which can be changed in settings). I know there are several tools like this out, but I don't know any supporting custom ftp servers and I just want to create it lol. :)

Is it possible to upload a screenshot, for example saved in a picturebox to a ftp server, without saving it somewhere on your harddrive? Because wouldn't it damage your HDD over long use?

If it doesn't work is it safer to use a for USB stick to temp save the files and upload, then delete again?

Thanks in advance. ?

You can upload the Byte[] from your created Bitmap.

Isn't it bad for a HDD to create and delete files over and over again?
btw pic lost quality due to watermarks#

Gonna check tutorial anyways, thank.

Okay got it working.

Picturebox is converted into bytearray and then uploaded with UploadData.
