Thread: [Good SMTP for sending bulk email/spam email?](#)

apt-get money - July 28, 2014, 12:33 pm

Anyone?

Doesn't have to be free. I just want to have a good SMTP server which will deliver to the inbox.

Niely - July 28, 2014, 2:18 pm

You don't necessary need to have a special SMTP server. :)

You could easily make a VBScript file to send a mail, and loop it:

```
Code For var = 0 To 15
```

```
Set objMessage = CreateObject("CDO.Message")
```

```
objMessage.Subject = "Spam"
```

```
objMessage.From = "someone@fakeinfo.com"
```

```
objMessage.To = "victim@gmail.com"
```

```
objMessage.TextBody = "You got spammed!"
```

```
objMessage.Send
```

```
NextSave as anything.vbs
```

Quote:For var = 0 To 15

Next

A loop in VBScript who will repeat that process 15 times! :)

You could also just use a small basic mail provider like Hushmail.

Use an auto-clicker-bot to send it multiple times. :)

(Auto-click on send button = send multiple times = spam).

Good luck!

Other uses (who maybe also use the search button and get on this thread or just browse it) would like to know that option as well. :)

Just post it in this thread so everyone can see it, otherwise the search function would be useless and beginners can't learn.

I doubt that a spamming option is so illegal it needs to be discussed in private. ;)

Nah, I need an SMTP. I'm going to be using sendblaster and a huge mailing list. I don't feel like using scripts which are unstable and don't provide me what I am looking for.

I'd much rather find a good SMTP.
