Thread: [Found 'Database search and replace' on wordpress site. What next?](#)

joeever11 - July 31, 2014, 5:22 am

So I was scanning a wordpress website using WPScan in Kali Linux.

I found out that they replaced their databases recently and they didn't uninstall the script.

I found a url to this script:

<https://interconnectit.com/products/search-and-replace-for-wordpress-databases/>

The url is:

website.com/searchreplacedb2.php

I saw you can edit the database with it easily. Now I don't want to make fast decisions and I want to know what to do next, should I somehow find out what the current databases contain first or should I make one and change it directly?

Hope some people can help me :D

I'm in the wordpress admin panel at the moment. But there is one big problem: I can't upload shell's as read only is enabled and when I want to upload a plugin I need to enter ftp details which I don't have...

Is there a way to bypass this?

I have tried editing plugins/theme, none worked

asm-99 - July 31, 2014, 3:11 pm

^ try login to the ftp using the information you got from the DB

have you tried editing themes to inject a shell there?

Yes, I can't edit them because Read-Only is enabled on the ftp, which I don't have access to.

yassinemks - *July 23, 2015, 2:52 pm*

please i have get a user and password of database how i can connect to database

dalekdj - *August 21, 2015, 8:51 am*

Hi to all,i'm new.

how is possible to use the exploit ?

sun215 - *March 2, 2017, 2:57 am*

Hello, i have the same problem, am i able to watch content of database with this script? I've already tried to use exploit above, it shows database, and that's it. Currently mysql port is close, so this script is my last hope. Any suggestions. Thanks.

Maybe i can somehow add new user, or just see current database.
