Do you know what "Extra flags" do and what you should write there? I've understood that it's a setting for your computer to know if it should work 100% or something else with mining. But I haven't got it working.

At the moment I'm using a Nvidia Geforce 9600 for ~16 Mhash/s.

Thanks in advance

OP, I know you're just trying to help, but mining BTC with CPU or GPU is pointless.

Why stress your hardware for only 1 cent a month ?

The electricity charges will over-run the amount of BTC earned. So overall mining from one's own system is loss.

Ortek - August 4, 2014, 3:35 am

This has been told so many times before, if people just did a little bit of research before posting this kind of useless info.

Burning away so much money to gain 1 cent a month....im out of words tbh
