Thread: [Puush/Gyazo type program that allows me to enter my own server details?](#)

Browzer - August 6, 2014, 12:59 am

I'm looking for an OS X/Windows compatible program that'll allow me to enter my own server details instead of using Puush etc.

Are there any out there?

Nutar - August 6, 2014, 1:02 am

I don't think there is. You'd have to create your own, or maybe reverse engineer one. Also, this is the wrong forum.

Can you point me in the right direction? I think there is more work on the PHP side of it than the actual exe side of it

Ayzhin - August 6, 2014, 1:15 am

Try this:

<https://hackforums.net/showthread.php?tid=4370293>

Well, there is work in both sides. First, you want your application to POST the image to your script and the script will upload it to a directory you have set. It will then show the link of the image, and your application will display it.

I think VB.NET could do that. But you'd have to make the application keep listening for the PRNTSCR button when it's clicked.

If you're going to use this, you'd have to edit it so that it would upload it to your own servers.

I think VB.NET could do that. But you'd have to make the application keep listening for the PRNTSCR button when it's clicked.

It wouldn't be print screen, it would be a random button combination to allow me to select a portion of the screen.

I'm sure Puush could be reverse engineered to edit the server location

This is no good to me, it's not Unix compatible and uploads to Imgur

If you think so, give it a go. But I doubt that.

You may try this, <http://getgreenshot.org/> . It's open source.

Ah alright. Are you looking to create the application for your personal use, or just making it to release it?

Browser - August 6, 2014, 2:45 am

Personal use, puush was fine til they started deleting older files and using retarded URLs

Nutar - August 6, 2014, 2:49 am

Try lightshot, it's great. Plus, they use imgur to host the images.

Black?jack - August 6, 2014, 3:14 am

Google for ScreenCloud. It works on Windows, OSX, and Linux, and lets you upload to their servers, Imgur, or your own FTP or SFTP server.

Why don't you read? pls ppl

I've clearly stated that I put it in this section because I guessed there is more php work involved in it than anything else

You didn't state that in the OP. Anyway, no.. the PHP side is the easy part. There's a source floating around that does exactly what you need, but I think it's written in C# and so won't be cross-platform. If you're interested in that, I'll look around for it, just lemme know if it's any use to you.

You could also check out ShareX, best screenshot tool I ever used. You can either chose out of some different image hosts or enter your own.

It also allows you to add effects to your images or to record gifs. :3

Aura - August 6, 2014, 5:33 pm

There's ShareX that'll do the job :

<http://getsharex.com/>

But it's only for Windows I think.

Orianthi - August 6, 2014, 6:10 pm

I use lighshot fast upload and hosted on imgur.

Jaex - January 8, 2015, 10:41 pm

ShareX supports both FTP and custom uploader. With custom uploader you can use your own file hosting services.
