Thread: [skype4com handler crashing?](#)

shooterbret - August 17, 2014, 5:30 pm

I have made a bot for Skype in vb.net but every 15 minutes or so after use it stops responding. This is the code:

```
Code Private Sub K9Bot_Load(ByVal sender As System.Object, ByVal e As System.EventArgs)
Handles MyBase.Load
    Dim Skype = New Skype
    Skype.Attach(7, False)
    AddHandler Skype.MessageStatus, AddressOf skype_MessageStatus
    'AddHandler Skype.MessageStatus, AddressOf whoknows
End Sub

Public Sub skype_MessageStatus(ByVal msg As SKYPE4COMLib.ChatMessage, ByVal status As
TChatMessageStatus)
    'MsgBox("regulator")
    Try

        If status = TChatMessageStatus.cmsReceived Or status = TChatMessageStatus.cmsSent Then
            Label4.Text = msg.Body.ToString
        If msg.Body.StartsWith("!") Then
            Botstring = msg.ChatName.ToString
            form1.ListBox12.Items.Add(msg.Body.ToString)
            Label2.Text = msg.Body.ToString
            If msg.Body.Equals("!help") Or msg.Body.Equals("!menu") Then
                msg.Chat.SendMessage(form1.TextBox17.Text.ToString)
            End If
        End If
    Catch
    End Try
End Sub
```

I think this is the handler because I set the label to change to the text each time a message is sent.

I have also tried this:

```
Code ElseIf status = TChatMessageStatus.cmsRead Or status =
TChatMessageStatus.cmsSending Thenbut it makes it glitch so it sends 2 messages at a time.
```

After I tried all of this I made a log to see what was causing it and it wasn't anything specific and it was anything to a simple command, to someone just sending me a message. Does anybody have a clue what is causing my bot to do this. Any help will be appreciated.

(Aug 17, 2014 05:30 PM)shooterbret Wrote: [\[CITE\]](#) ElseIf status = TChatMessageStatus.cmsRead Or status = TChatMessageStatus.cmsSending Then

The reason this is sending two messages is because you're checking to see if the message has been read, and then again if the message has been sent.

You'd have to check either one, but I'd check to see if the message has been read instead of sending.

Simply remove one of the if statements.

Code:

Code Elself status = TChatMessageStatus.cmsRead Then
That should work, best of luck.

I see, I have a perfect working bot and I don't need that line, but I have also a completely different code. I can't help you with a simple answer, You'll need to do some code changes.

shooterbret - August 18, 2014, 2:26 pm

^^^^ Well anybody have a clue what 'code changes' he was talking about, because what doing what incliment says makes it so i need to type the code twice which is going to be annoying, also that still doesnt solve the main problem.

I honestly wouldn't waste money on something like that as its not very hard at all. Par your request here is source-code for what you are trying to do <https://hackforums.net/showthread.php?tid=4335463> . And contrary to what whoever said it, it's completely fine to check cmsSending and cmsReceived(or read I cant remember) at the same time. The source code works fine as long as you follow the very last step on the source code. It wouldn't be very hard at all to expand from this as its just a bunch of if then's following the main logic for resolving you could just say look for the command "!WHOIS" and then just take all the proceeding text and assume it to be an ip, then find a free online WHOIS API and just go from there!

Best of luck! ?

Best of luck! ?oh yea my thing is already pretty much done, tbh i just added in the necessary things like the resolver and geoip tracer thing.I really done see the point of all this other shit like a cloudflare resolver, or a is-it-up thing in it.Also i tried your bot and it didnt work for some reason, including the initial--

Code If message.Contains("!resolve:") Then

msg.Chat.SendMessage(botname & " says: Processing...")--

That didnt even send me the message or put anything in the listbox , also when u said last step of it i dont know what u mean, do u mean this: Code skype.ResetCache() 'Reset our skype cache

As someone who is new to vb.net i hate using code that i dont understand at all, which is exactly what i did when i saw this in your code, I dont really understand what it does but i tried it anyway and it semi worked, The first line of code to request the msg.body worked untill the ones after it, idk what really happened but it just got glitchy.

Code Private Sub newmsg(ByVal msg As ChatMessage, ByVal status As TChatMessageStatus)

```
'Cary the message info over to skype_messagestatus while also putting it in a new thread  
Dim newthread As New Thread(Sub() skype_messagestatus(msg, status))  
newthread.Start()
```

End Sub
This is what i put into the code along with your handler but that didn't seem to do anything. Also when the cache is cleared what exactly does that do.

hate to bother you, but like you said it is something not worth paying for, and i don't plan to.
if anybody else has suggestions feel free to tell me.
