Thread: [SQL Inject ---- Minecraft server](#)

Moosey?™ - August 23, 2014, 4:26 pm

Can an SQL Inject be used to access/hack files being used by a minecraft server using an SQL data base?

The Sly - August 24, 2014, 2:44 am

If the webserver has an SQL injection vulnerability, I don't see why not.

OMGNEEDSLEEP - August 24, 2014, 3:44 am

Yep, it can. But it depends on what files that are stored in the MySQL database, dont know what you wanna access?

You probably did need some sleep because this post is inaccurate. The specific files stored in the database have almost no impact on SQL injection vulnerability existing in a web application. A specific vulnerability or exploit may exist due to the files stored in the database as you have suggested; but this is not example of a true SQLi attack vector. ?

?

I'm sorry but I think you misunderstood my post.???

Th3PonyWizard - August 24, 2014, 3:03 pm

That depends strictly on the parser responsible for processing your user input.

Best way to "hack" minecraft server is to perfrom a ddos attack sql injections are kind of useless, if you still want to do sql injection do it to their website, minecraft server websites are pootly programmed, with tons of flaws, if the site is php based go on and fuck it up!
