Thread: [API Manager Source Customization - Add stop method, make API settings user dependent](#)

Taranis - August 26, 2014, 1:26 am

Hi guys ,

Cracking my head about this one, and really need a hand from an experienced php/mysql coder !

Currently I'm using an API Builder source which allows to add methods and servers in the admin panel.

The problem is even if you create a new user using the install.php it will share same settings of everyone else.

I want it setup in a way so the database saves the settings for each user, which will allow me to add different servers and methods for each of the API's.

The source is already able to generate new users with keys but the servers are currently shared by all the API's

Shouldn't be too hard for all those you php pros out there ?

Please tell me if you can do this on a budget

Thanks ?
