Thread: [Websource sorting issue](#)

NitroSmily - August 29, 2014, 8:25 am

Hey guys, I've started a new project. I've completed the Probux Ad Viewer and I need some help with this. Basicly for each class called "lolz" I need to check if it has a picture url that contains "money". The first code you see below is how I've sort of got it to the point where I need to get the url of a picture.

The last code is from the site. I'd really appreciate some help and thank you for your time!

Code Private Sub Button2_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles Button2.Click

```
Dim theElementCollection As HtmlElementCollection = Nothing
theElementCollection = WebBrowser1.Document.GetElementsByTagName("div")
For Each curElement As HtmlElement In theElementCollection
    If InStr(curElement.GetAttribute("classname").ToString, "lolz") Then
```

```
End If
```

```
Next
```

```
End SubCode <div class="lolz" style="float: right; background: url('hidden')"></div>
```

Do you mean something like this? ?

Code Private Sub Button2_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles Button2.Click

```
For Each curElement As HtmlElement In
WebBrowser1.Document.GetElementsByTagName("div")
    If curElement.GetAttribute("classname").Contains("lolz") Then
        Dim curElementImg As HtmlElementCollection =
curElement.GetElementsByTagName("img")
        If curElementImg.Count = 1 Then : If
curElementImg.Item(0).GetAttribute("src").Contains("money") Then
            'some code
        End If : End If
    End If
Next
End Sub
```

Code Private Sub Button2_Click(ByVal sender As System.Object, ByVal e As System.EventArgs) Handles Button2.Click

```
For Each curElement As HtmlElement In
WebBrowser1.Document.GetElementsByTagName("div")
    If curElement.GetAttribute("classname").Contains("lolz") Then
        Dim curElementImg As HtmlElementCollection = curElement.GetElementsByTagName("img")
        If curElementImg.Count = 1 Then : If
```

```
curElementImg.Item(0).GetAttribute("src").Contains("money") Then
    'some code
End If : End If
End If
Next
```

End Sub I tried and didn't get any results changing lines here and there, but I've changed method and now I need to search for a word in a richtextbox then retrieve the the entire line.

I thumbed and stopped when I got this:

```
Quote:    For Each Line As String In RichTextBox2.Lines
    If (Line.ToString = "Lolz") Then
        ListBox1.Items.Add(Line)
    End If
Next
```

Haru9 - August 30, 2014, 2:40 am

```
Code For Each Line As String In RichTextBox2.Lines
    If (Line.ToLower.Contains("Lolz".ToLower)) Then
        ListBox1.Items.Add(Line)
    End If
Next
Code Dim line_number As Integer =
RichTextBox2.GetLineFromCharIndex(RichTextBox2.Find("Lolz"))
Dim line As String = RichTextBox2.Lines(line_number)
ListBox1.Items.Add(line)
```
