Thread: [Programming keyboard?](#)

Aur3xis - August 30, 2014, 1:25 am

Yo guys, im searching a nice not too expensive mechanical keyboard...I mainly will use it to program, im atm using razer blackwidow, but few keys are broke after 3 months of usage.

GL1TCH3D - August 30, 2014, 7:25 am

That's what you get for buying razer. And when you say not too expensive what is expensive for you?

For me a not too expensive mech keyboard would be \$200, for others it might be \$100, or \$50. I've seen people spend \$600 on the spot for a nice custom keyboard

Aur3xis - August 30, 2014, 9:16 am

150\$ would be a good price to get a keyboard, i guess... that will not fckin break after few months :P

It's hard to go wrong with a ducky shine 3 keyboard. Familiarize yourself with the different mechanical switches.

Niely - August 30, 2014, 11:21 am

I actually don't recommend a mechanical keyboard for programming (the noise etc.).

A good standard easy-to-type, low noise is just what you're looking for. :)

GL1TCH3D - August 30, 2014, 11:52 am

(Aug 30, 2014 11:21 AM)?Niely Wrote: [\[CITE\]](#) I actually don't recommend a mechanical keyboard for programming (the noise etc.).

- 1) OP never said he had to take noise into consideration
- 2) even if noise was a problem there are half a dozen switch types that are silent and you can further silence any noise with o-rings.

Niely - August 30, 2014, 2:24 pm

- Yeah... ?

I look stupid:

?

Also, just keep calm... Did I ever pointed you out/said you were wrong?

I personally (MY OPINION) don't suggest mechanical key-boards after some experience with programming.

c x y k - August 30, 2014, 2:27 pm

http://www.ttesports.com/Keyboard/3/Challenger_Pro/productPage.htm?a=a&g=ftr#.VAJBp_WCOSM

That's what I use, it's a beauty for programming in my opinion.

I know what they are but either way a rubber still does the job as long as you don't get a cheap keyboard. Sure with the mechanical you will get a guaranteed 100% press rate but is it really worth the extra cash for a regular keyboard 70% cheaper with a 94% press rate. Unless he's launching a nuke or plays a MOBA where you must press that key no matter what, a small error won't really hurt a programmer as a good programmer always checks his work. Also honestly this whole Mechanical keyboard is the master race and rubber peasants must bow down to my 100% accuracy is pathetic. Kinda kills the whole PC is cheaper and consoles are expensive argument as well XD.

What? Are you serious right now?

How fucking stupid can you get..

are you 12?

explanation ([Click to View](#)) Mechanical does not mean it is designed for gaming, in fact none of the switches other than the stupid razer mechanical switches were designed with gaming in mind. They were all designed to suit the person that is typing. Most programming companies use mechanical switches because they are so much nicer to type on for long periods of time.

The first keyboards to hit the shelves were mechanical, maybe you should do some research you fucking spastic.

[img]http://cdn.arstechnica.net/wp-content/uploads/2013/11/iljitsch-model-m-1a.jpg[/img]

Does this look like it was made for 'gaming' ? No. It is one of the most sought after mechanical keyboards, why? Because it is fucking amazing to type on.

GL1TCH3D - August 30, 2014, 3:42 pm

(Aug 30, 2014 03:13 PM)Popstar Ahri Wrote: [\[CITE\]](#) I know what they are but either way a rubber still does the job as long as you don't get a cheap keyboard. You obviously don't understand that mechanical switches feel different.

You're also seemingly ignorant on the subject. People don't buy the mechanical keyboards because they have lower failure rates, they buy them because they feel better to them

(Aug 30, 2014 03:05 PM)?Niely Wrote: [\[CITE\]](#) ...

http://en.wikipedia.org/wiki/Model_M_keyboard

Did you read anything we've posted?

It is ignorant for you to attack others for not having the same opinion as you. Honestly I may have just started programming but I have yet to buy a keyboard for the feeling with a slight chance of faster typing and 100% accuracy. Now today majority keyboards don't have any ghosting unless you buy cheap. Most of the stuff you recommend are priced above someone needs or just straight up very biased. Love how you attack others for just buying beats or razer...SMH they are stupid for buying it but let them be dumbasses. Wonder if this get's you mad, Im going to buy some Jlab J5's headphones.

Niely - August 31, 2014, 11:29 am

That's the same as I'm asking someone specific how they are and to PM me, and that you'd PM me and answer how you feel. Then if it's a private conversation don't have it in a public place.

Not that this would ever apply to you but it's the equivalent of having sex in a public place and expecting others to ignore you.

And basically what I'm getting from your argument is:

"I'm too stupid to understand what a mechanical switch does so I'm just going to say I'm right"

Preference is dependent on person but even then there are still mechanical keyboards that feel like upgraded membrane keyboards. You clearly have not had any experience with mechanical keyboards.

Consistency between batches. That you can't even argue is preference. Do you even know what that means?

Options of audible feedback. It's a fucking fact that there are different mechanical switches. Yet here you are claiming that a quiet mechanical switch is the equivalent of finding an alien.

(Aug 31, 2014 11:55 AM)Popstar Ahri Wrote: [\[CITE\]](#) O yes because i am against mechanical keyboard o you got me! Why don't you go read my guide on HF here about purchasing and maybe you'll understand something.

By saying the only worthwhile purchase of a keyboard is a \$2 membrane keyboard then that must mean by extension there's no benefit to mechanical keyboards.

Oh wait. You already contradicted yourself there. You already recognized that mechanical switches are superior in consistency. (Even though there are many more positive aspects that you either ignore or just haven't bothered to even research)

Niely - August 31, 2014, 12:34 pm

Then if it's a private conversation don't have it in a public place.

Not that this would ever apply to you but it's the equivalent of having sex in a public place and expecting others to ignore you.

No, it's not the same at all. o_O

Do you mess yourself into a conversation in a train between two people?

Preference is dependent on person but even then there are still mechanical keyboards that feel like upgraded membrane keyboards. You clearly have not had any experience with mechanical keyboards.

Some but not all, note which do feel like membrane then and which not.

Consistency between batches. That you can't even argue is preference. Do you even know what that means?

Explain your argument then, Could be possible I misunderstood of my less-good English.

Options of audible feedback. It's a fucking fact that there are different mechanical switches. Yet here you are claiming that a quiet mechanical switch is the equivalent of finding an alien.

Most mechanical keyboards (not all) are extremely loud, otherwise they wouldn't be that known for it.

Price $\neq$ Quality.

Quality also depends on for what you're using it.

A Ferrari is quality, but not for off-road tracks.

Then if it's a private conversation don't have it in a public place.

Not that this would ever apply to you but it's the equivalent of having sex in a public place and expecting others to ignore you.

No, it's not the same at all. o_O

Do you mess yourself into a conversation in a train between two people?

Preference is dependent on person but even then there are still mechanical keyboards that feel like upgraded membrane keyboards. You clearly have not had any experience with mechanical keyboards.

Some but not all, note which do feel like membrane then and which not.

Consistency between batches. That you can't even argue is preference. Do you even know what that means?

Explain your argument then, Could be possible I misunderstood of my less-good English.

Options of audible feedback. It's a fucking fact that there are different mechanical switches. Yet here you are claiming that a quiet mechanical switch is the equivalent of finding an alien.

Most mechanical keyboards (not all) are extremely loud, otherwise they wouldn't be that known for it.

I've been in this conversation since the beginning

Have you tried topre keyboards?

Consistency between batches means that every mechanical switch should feel almost exactly the same in feeling and quality. The same cannot be said about membrane switches.

The only reason they're known for being louder is because you don't get membranes that can make noise

Ahri????? - August 31, 2014, 5:01 pm

Consistency between batches. That you can't even argue is preference. Do you even know what that means?

Options of audible feedback. It's a fucking fact that there are different mechanical switches. Yet here you are claiming that a quiet mechanical switch is the equivalent of finding an alien.

What is best bang for the buck by definition?

Why don't you go read my guide on HF here about purchasing and maybe you'll understand something.

By saying the only worthwhile purchase of a keyboard is a \$2 membrane keyboard then that must mean by extension there's no benefit to mechanical keyboards.

Oh wait. You already contradicted yourself there. You already recognized that mechanical switches are superior in consistency. (Even though there are many more positive aspects that you either ignore or just haven't bothered to even research)

Idk where you got the idea where I thought mechanical keyboards are bad but obviously they are better. Although you must look at cost per benefit. No I won't look at your guide as all it does is gives you more attention.

Great! How does that compare to keyboards?

As far as I'm concerned you're actually proving my point more than anything.

Using a car built for off road on an off road track and using a Ferrari built for speed on a flat way are

the equivalents of using different mechanical switches for various needs. If you want to compare cars to keyboards, the best comparison to make is that membrane keyboards are essentially public transit. It sucks to have to use it in a lot of cases with no real benefit besides being cheaper.

This is a pretty silly analogy. Yes, a Ferrari is better for on-road than off-road. However, a mechanical keyboard is genuinely better in every respect than a membrane keyboard, except for price of course. There is no reason why a mechanical board would be worse than a membrane keyboard at any task.

I do a lot of typing (programming included, if I have to mention) and I would never trade my NMB for some squishy rubberdome, even my old Quietkey. It's down to preference, in the end. Someone can use a rubberdome if they like, but when they start preaching that it's objectively better than something else because they like it more, then they're wrong. That's what's happening here.

This thread needs to be locked.

3) I do otherwise I couldn't be helping people. Sorry, I should have specified "can only read at 12 year old levels"

Your analogy doesn't take into account rubber dome keyboards. It doesn't take into account different mechanical switches being built for different purposes.

In an argument about comparing 2 different technologies you completely ignore most of the factors involved.

You have yet to argue anything and at this point I'm assuming you're just post whoring or are mad because I neg repped you for being a douchebag and trying to mislead people.

Otherwise prove me wrong.

Here's a summary:

You claim mechanical keyboards are only for gaming when in fact they were originally designed for a better terminal experience. Companies spent over \$100 PER KEYBOARD back in the 1980s to buy the IBM Model M for their terminals.

You claim all mechanical switches are the same when the technology used in each one is different. Topre uses a capacitive technology which is very different from cherry MX because there's no actual contact for the switch to activate.

And yet you still claim they're all the same.

You claim rubber domes are superior by spewing BS that facts and technological designs are based on preference. No. Just no. You're not god. You can't just wave a magic stick and make it so every mechanical switch feels the same.

But you're still here rubbing your dick on rubber domes because you want to feel important. You want to feel good when someone takes your suggestion even if your suggestion is based solely on your opinion which is absolutely worthless.

(Sep 2, 2014 06:48 PM)Builder_Geeza Wrote: [\[CITE\]](#) Why're you all even arguing about this;

Neither keyboard is 'better', even with facts and statistics.

In the end, it all comes down to the end users preference, if s/he likes a certain type, then s/he will buy the said type.

It's a matter of opinion. Has a new troll joined the fray?

Is every car the same?

"Don't worry, those Ford cars with engines that are blowing up under normal circumstances are just as good as that Ferrari there. Please, pay me \$300k for it"

The fact you start to attack personal (at my reading-skills, however those are actually very good) says more about your low age and the fact you actually see you're losing this discussion.

Please, quote where I stated that all (Only for programming and that rubber is superior part), where did I stated that all?

I said that mechanical keyboards are most of the time made for the gaming industry, that's just a damn fact.

From personal experience I know that membrane keyboards give a lot smoother feeling then mechanical ones which is quite important in programming.

Quote:Has a new troll joined the fray?

Basically what I'm getting from that text I just quoted:

"U luuk stupid cuz u know moar about keyboards den me. Hurt durr #logic"

Ahri????? - September 3, 2014, 4:57 pm

(Sep 3, 2014 03:59 AM)GL1TCH3D Wrote: [\[CITE\]](#) The differences between rubber domes is not the same as differences between mechanical switches. They're still crappy and squishy with a lot of inconsistency.

The lower end mechanical keyboards are in the \$50-60 range. You're telling me you can't afford \$50-60 for a keyboard to last 5-10 years and that will feel better when typing AS A PROGRAMMER? And for all the BSing you do you haven't given any arguments for rubber domes.

I've already argued for Mechanical keyboards but it seems every time I give any argument for them you cover your ears and eyes, turn away, fap off to your rubber dome then skip to the next comment.

Rubber dome is an inferior technology.

Price wise rubber domes are only really worthwhile for up to \$20 then after that it's better to invest in a mechanical keyboard

But I thought you are the pro in keyboard reviews shouldn't you know the positives? Na sadly you are too biased. Also who says I like rubber domes LMAO, where did you get the idea I am against mechanical? Anyways for benefits cheap and dependable.

GL1TCH3D - September 3, 2014, 5:51 pm

(Sep 3, 2014 04:57 PM)Popstar Ahri Wrote: [\[CITE\]](#) But I thought you are the pro in keyboard reviews shouldn't you know the positives? Na sadly you are too biased. (Sep 5, 2014 09:47 AM)?Niely Wrote: [\[CITE\]](#) No. It isn't damn shorter.

Big recoil = big bounce (And you call me an idiot).

Key Travel Distance: Membrane keyswitches are usually 'full-travel' i.e. the key will move down between 3.5 - 4.0 mm before 'bottoming out', and the elasticity of the membrane returns the keycap and associated plunger to their default 'up' position.

Mechanical keyswitches are more intricate and of higher quality than other keyswitch types.

In most cases the key is actuated (that is the keystroke is generated and sent to the computer) halfway through the key travel distance. For example, the key may be capable of traveling 4 mm before hitting the bottom of the keywell, but the keystroke is generated after 2 mm.

You really are a retard aren't you?

Or are you so delusional and stupid that you'd think you can convince me that rubber domes are superior when they're technically inferior in almost every aspect.

And "bounce back" is a hell of a stupid term to use. Same with recoil. There's no explosion. No surge of force.

If you're talking about the key returning to the original position then I would say that's what a keyboard should do. If the key sticks like in a lot of the shitboards you expect people to buy then that's bad.

Wireframe - September 6, 2014, 2:06 am

I've been using Logitech G710+ mechanical keyboard for bit over a year now.

Best keyboard I have ever had.

I don't really care if its noisy or not.

Before G710+ I used Razer Blackwidow ultimate about one year, but then it stopped working.

He can't discuss without flaming because you have no reason or logic in the vast majority of your posts. I seriously became mad just reading your posts on this thread.

Those "membrane" keyboards you posted look absolutely horrible, I would hate typing on one of those. Mechanical keyboards actually feel like keyboards, feeling the keys press down really helps me type and to know I pressed a key. When I'm typing on a laptop or a tablet I don't get that kind of response.

I'm no keyboard expert, but mechanical keyboards are definitely better. For reference, too, I program.

I have no idea what the fuck a cherry whatever the fuck switch is, nor do I have much knowledge on the types of keyboards and their layouts. But I do know that mechanical keyboards are really fucking good.

If you can't discuss without flaming you're really immature, a kid, can't control a situation, sad, weak,... There's no reason to flame, even not a 'non-logic post'. ?

Those keyboards are in my opinion twice as handy because you can just 'fly' over the keys and press them.

And, you know when you pressed a key once it appears on screen. ?

1) Explain thumb sized keyboards

2) Wrong. You have no choice in layout or switch type when just trying it for 5 minutes at a friend's house. You don't have enough time to adapt to it. I completely understand why you're such an idiot when it comes to keyboards now.

3) Read the above.

4) You keep calling me weak but you refuse to answer any questions or post any information. You just go on about how you love to jack off to membrane keyboards (even though it seems like you've never owned a mechanical keyboard for reference).

And if you don't understand logic nor do you have any relevant information on the subject why do you post? That's my reason for making personal attacks. You don't have a reason to post yet you do.

(Sep 8, 2014 02:45 PM)? MD5 ? Wrote: [\[CITE\]](#) You can use any normal keyboard for programming, no need for special functions

I'm pretty sure not even the idiots have mentioned special functions like macros in the past 14 pages. Why bring it up here?

Aperture? - September 8, 2014, 4:46 pm

I read through ~80 of the 136 posts on this thread, and, to be honest, this conversation is kinda stupid. I use a Ducky 9087 G2 Pro (Shine 3 without backlighting, basically) with reds and 40A-L o-rings, because I type a lot and I need the keyboard to function well for gaming, but I wanted to minimize the noise I make.

One thing everyone should note is that there are more than 10 different types of mechanical switches. You have Topre, Cherry red, brown, black, blue, green, clear, white, etc., and then you also have Khail and a few other manufacturers of "cherry-like" switches. There's also buckling, as shown in the Model M. As for non-mechanical switches, the common ones are membrane and scissor. Membrane switches don't have any real classification system, but they're not all the same, either. Scissor switches, like depicted earlier, are non-elevated keys with really short keypresses, that actuate when you bottom out. They are actually classified as an offshoot of mechanical switches, so no, they have nothing to do with membrane switches. If you look at the actual mechanism, scissors are much closer to mechanicals, but, due to how short they are, they can fit in laptops. In my opinion, they feel awful.

The main (mechanical) switches people know are Cherry MX red, brown, blue and black. Red and black (red is 45g actuation, black is 60g) make almost no noise, unless you bottom out constantly, in which case you can just install o-rings if you don't like the noise. Browns are the original design for tactile mechanical switches (if I recall correctly), and they have an audible (but not loud) click, and are, obviously, tactile. Blues are actually browns modified so that the click is even louder, but they're the same as browns besides that and the slightly higher activation force. If none of these three suit your preferences, you have a ton more Cherry MX switches to choose from, with all sorts of different actuation forces and tactility and sounds. The next step is Topre, which uses an electrostatic mechanism, so there is no click at all. Like gl1tch3d said earlier, they're like an upgraded membrane keyboard. Buckling is renowned for feeling amazing for typing as well.

Essentially, what you want to do before bashing any sort of keyboard is try 15 or so types of keyboard switches, so you know what a decent percentage of them feel like. One of the main reasons people choose mechanical keyboards is so they can choose something to their preference, because there are so many options and the classification system is superior. For a programmer, having an optimal keyboard is considered necessary, simply because you spend so much time using it. Saving \$100 and having an inferior workflow is not worth it.

In addition, comments about quality are useless. There are high-quality membrane keyboards, just the same as there are high-quality mechanical keyboards. (Might be harder to find, though.) Switch type says nothing about quality, although mechanical keyboards will last for more keypresses. Some people actually prefer membrane keyboards for gaming (and other stuff, but that's what I found most surprising). Most people end up not liking the feel of membrane keyboards, though, because mechanical switches have been developed far more over time, and many types have been created to suit the many different types of users. Regardless, in the end, it comes down to your preference.

datguy.dev - September 8, 2014, 7:03 pm

Have anyone suggested the ducky shine 3? It has no advantage really, illuminated key, but the lights ripple away from the key presses. Kreygasm. If your going to use a mech, you want it to be loud as hell and flashy right? EDIT: above post much?

I use a Logitech G510. I can't say if it's great or anything, but all those macros come in handy. I assign them to all the hard to remember functions or aliases I use all the time.

Niely - September 9, 2014, 12:50 pm

I don't see what that has to do with mechanical keyboards.

You keep saying rubber domes have lower actuation distance but they usually have double the distance.

You keep saying they're lighter when you can either easily change springs to make the keys lighter or buy a lighter switch in the first place

Niely - September 10, 2014, 10:12 am

(Sep 10, 2014 09:26 AM)GL1TCH3D Wrote: [\[CITE\]](#) You keep saying rubber domes have lower actuation distance but they usually have double the distance.

1) No. How can a flat keyboard have a longer way to press then a mechanical keyboard? It's actually like a touch-screen but better (you still have to press but only a bit, you still feel a 'bounce' but again, only a bit.

2) True, that's true. But again you have to buy then and again need to spend money, and again changing stuff, But indeed. that's true.

Aperture? - September 10, 2014, 1:05 pm

I don't really want to join in this argument, but I have to point out that, because of the way the switch is designed, membrane keyboards usually have a total key travel distance between 3.5mm and 4.0mm, but the actuation distance is almost the same as the total travel distance. Cherry MX switches have a total key travel distance of exactly 4.0mm, but the actuation occurs at exactly 2.0mm, so you don't need to fully depress the keys for the keystroke to register. Scissors have an actuation between 1.0 and 2.5, and again this is the same as the total key travel distance. While it might be shorter, scissors actually force you to bottom out completely (it's not "complete" with membranes), which is rather uncomfortable for most people.

You still haven't understood the simple fact that mechanical switches don't have to be pressed down all the way. This leads me to believe you barely used any in your life.

If you don't care about the typing experience then you don't care. And like I discussed earlier just because an item is cheaper by MSRP it doesn't mean it's a worthwhile investment.

My \$300 keyboard will last much longer than any of your \$20 membrane keyboards.

Aur3xis - September 11, 2014, 11:28 pm

Maybe we can stay on-topic? and diss each other via PM ? :)

Aperture? - September 11, 2014, 11:36 pm

Yeah I think it's pretty funny how he asked for a good keyboard (and specified mechanical), and it became an argument about mechanical vs membrane keyboards.

Anyways, I'd recommend getting a Ducky Shine 3 or G2 Pro (they're the same, just one has backlighting and the other doesn't), since Ducky keyboards are just generally well-built and good (go TKL, unless you really like the numpad). Another good keyboard manufacturer is Das, I've never used one but a lot of my friends say they're really good.

On the other hand, if you want to get a really cheap, well-working mech you could get a CM Storm QFR. It's cheaper than most other keyboards, and it works just fine. If you want to spend more money, you can look at Filco MJ2 or even something like a Topre (different switch type) or a HHKB if you're really rich. If you don't know the acronyms, just search them on Google.

Also, most people like browns and blues the best for typing, but that's up to you.

Niely - September 12, 2014, 9:50 am

(Sep 11, 2014 02:25 PM)GL1TCH3D Wrote: [\[CITE\]](#) I'm going to ignore your first point because you don't know how tactile switches work.

As for the second point, certain keys are used a lot more often. Are you ever going to do 20M presses on F12? Probably not. 20M presses on spacebar? It's just a matter of time. Like I said before, rubber domes are generally made to much lower standards and the rubber dome switches themselves aren't designed to really last beyond 10M presses.

And for your last statement that means Ferrari = Honda right?
I know how they work:

[img]http://media.bestofmicro.com/Y/P/291553/original/animation_cherry_mx_red.gif[/img]

20Million presses (even on the space-bar) is more as enough.

And like I stated before, a Ferrari is nothing off-road (really off-road).

Cleaning and maintaining well help any keyboard but regardless the membranes will deteriorate MUCH faster (inherent property) and generally made with lower standards

And if anything a toyota is more like a red switch keyboard, good for anything, smooth, quiet while a ferrari is like a blue switch keyboard. Loud, fast, obnoxious.

The public bus is a membrane keyboard

Niely - September 14, 2014, 3:20 am

Yes Membrane will indeed break faster, but will last more as enough. It is not the case it will break after three years...

And that comparing isn't correct and just really idiot. A Toyota isn't in the price class of a Ferrari so also can't both be a mechanical keyboard in a comparison.

Not all mechanical keyboards are in the same price class dumbass. Just go read anything and you'll see.

Is the \$500 custom GoN keyboard the same as that \$50 rose will mechanical? No.

Is the \$500 kmac keyboard the same as a \$100 poker2? No.

You're still making the claim that all mechanicals are the exact same which is why I'm still calling you an idiot. You still haven't acknowledged that there are different mechanical keyboards built for different purposes and with different properties. You keep claiming they're the same and in your analogies you keep making them out to be the same.

Not that you should fully ignore price.

But that you shouldn't base only on price to say when ever some product is good or not.

Price is not equal to quality because it depends in what situation you use it (I explained the Ferrari not good for off-road example 5+ times because I thought that'd explain it).

A Ferrari is so expensive because it's a high-quality, good car on roads. As soon you go off-road with rocks, hills, mudder, sand,... Your Ferrari is nothing worth (and will probably break as well).

That same goes for Mechanical keyboards, they're so expensive because they're high-quality and really good in one specific purpose and one situation, but for other situations (in this case programming) you definitely want a membrane one (a flat scissor to be more specific).

Sure you don't, that's why you're still here when multiple people have confirmed you're an idiot and you're wrong?

Membranes are inconsistent.

Membranes are lower quality.

Membranes have lower durability. (Don't last as long)

Scissor switch is not the same as a standard membrane keyboard.

Scissor switch is closer to an in between from membrane to mechanical and is completely different in function than a membrane.

Membranes are slower. (You have to push the keys farther to activate)

Different mechanical switches are quieter / louder and made for different preferences. In your broken analogy this is the equivalent of having specific cars for off road and specific cars for on road performance.

These are not disputable. These are facts. Yet you still don't accept them. That's why you're a retard.

-How?

- How? Like I said, take a look at the situation.
- True, why repeat it the whole time while I was actually the first who said that one of the good points from mechanicals is that they last longer (50 million presses).
- Scissors is a part of membrane, so it does count
- Scissors are a part of membrane so does count in this discussion as well
- I almost don't have to put anything down on my flat key-board, my fingers just 'fly' over the keys.
- Which mechanical type do you recommend for programming then?

GL1TCH3D - September 14, 2014, 1:11 pm

Uhm, no.

Also, scissors does use a part of membrane;

Quote:It still uses rubber domes, but a special plastic 'scissors' mechanism links the keycap to a plunger that depresses the rubber dome with a much shorter travel than the typical rubber dome keyboard. Typically scissor-switch keyboards also employ 3-layer membranes as the electrical component of the switch.

Scissors and membrane aren't the exact same, and don't use the exact same 'system', but membranes does over-lay membrane.

Tranquility - September 17, 2014, 5:58 am

Isn't it better for everyone to accept people have different opinions (which aren't based on facts as they are opinions)

The OP said he would buy a keyboard suggested by someone on page 2 and this is at page 19 now.

As for assumptions made for the user perhaps wanting to have a cheaper option, it isn't up to you (or me) to assume that. Next time just give the guy a few good options, with a little bit of explanation and I bet the potential buyer will be more satisfied than reading through this yes/no topic =P

And which is better is up to a person's preference in the end, each to his/her own typing needs & demands.

Thanks for the enjoyable read though, learned a bit here & there and now I do wonder how the off-track car performs on-track compared to the Ferrari (or is that stirring up things too much xD)

But you still have to differentiate the facts.

It is fact that cherry MX brown have a tiny little tactile at the actuation. It is opinion to say they're better than another switch (like reds which don't have the tactile but are otherwise identical)

Niely just doesn't accept the facts and believes facts are based on opinion.

(Sep 20, 2014 01:39 AM)Popstar Ahri Wrote: [\[CITE\]](#) Bad GL1TCH3D Bad! We all know you love expensive keyboards and headphones but enough is enough.

I also like the correct distribution of information. If he's going to sit here and say everything is the same so just get the cheapest thing then I have a problem with that since it's clearly false (to me) but maybe not to others.

Niely - September 20, 2014, 5:21 am

(Sep 19, 2014 01:24 PM)GL1TCH3D Wrote: [\[CITE\]](#) You haven't said anything useful this entire thread.

You consistently post false information and illogical statements.

Considering you still don't recognize that different switches are different this is honestly how I imagine you

90% of my arguments were solid and you can't answer them.

If all I say is incorrect, just answer these two:

1. Scissor-switch membrane keyboard (the full name) does explain it's a membrane keyboard.
2. You have said yourself earlier in this thread that scissor indeed is membrane (that picture).

If you can't make an argument against those two, you've lost the discussion. Because that's were discussions go about, arguments. Not personally attacking another person saying he doesn't know anything about it.

~Tom~ - September 20, 2014, 5:29 am

I have the cm storm quick fire and I love it mate, you should check it out.

Lost the discussion?

You aren't even talking about mechanical #1 and #2 you don't even know what a mechanical switch is for a keyboard.

Before you go sucking your own dick please do consider that you've literally contributed nothing. Your so called arguments are you ignoring my explanations.

So go ahead and think that all keyboards are rubber domes Mr. Genius. You're obviously right. All keyboards are obviously rubber domes and you can't tell them apart because they're all the same, right? So why buy a so called mechanical for more?

Go answer respond to all my previous arguments in this thread that you ignored and then I'll respond to yours because quite frankly I'm certain you won't listen to my answer.

Considering you still don't recognize that different switches are different this is honestly how I imagine you:

What does it matter if I'm not talking about mechanicals, it's not the only kind of keyboard.

How haven't I contributed anything?

I've never said all keyboards with rubber domes are the same, but:

1. Scissor-switch membrane keyboard (the full name) does explain it's a membrane keyboard.
2. You have said yourself earlier in this thread that scissor indeed is membrane (that picture).

Please, quote the ignored arguments here; I'm not looking through 20+ pages.

Also, why haven't you answered these yet?:

1. Scissor-switch membrane keyboard (the full name) does explain it's a membrane keyboard.
2. You have said yourself earlier in this thread that scissor indeed is membrane (that picture).

I'm not going through 20 pages of your garbage and my arguments. I just assume you haven't answered anything at all because I don't remember you saying anything intelligent (and for someone as stupid as you it would definitely strike me as odd if you did)

As I said before, if you're not going to take the time to answer any questions properly or form any arguments then I just won't bother responding to your garbage.

Considering you still don't recognize that different switches are different this is honestly how I imagine you:

You actually posted most garbage (like that annoying picture for example).

And if it's garbage, just reply at at... Or can't you?

1. Scissor-switch membrane keyboard (the full name) does explain it's a membrane keyboard.
2. You have said yourself earlier in this thread that scissor indeed is membrane (that picture I posted a while ago).

Niely - September 21, 2014, 2:07 am

Yeah, seems clear.

Membrane overlays scissor switch (full name: Scissor-switch Membrane keyboards), Glitched even said that was right some pages ago.

And scissor-switch (who are often flat) are awesome to program (your fingers can just fly over it, a light press and a fast reaction).

Glitched can't give any reargument so means he also lost this discussion and can only begin to start attack personal.

I won't be wasting my time anymore here because Glitched only starts to post idiot stuff because he finally see he was wrong.

For me:
Discussion Closed

For me:
Discussion ClosedHow 2 wern orgumants by Nicely

Ferp off 2 pictoors of scisors wile oder hooman make point.
Lie n say me win orgumant.

Considering you still don't recognize that different switches are different this is honestly how I imagine you:

[IMG]http://fc04.deviantart.net/fs70/f/2011/045/f/5/hunt_and_peck_animation_by_fowlhunter-d39l6zc.gif[/IMG]

And if you're just going to ignore the past 20 pages of my information and just lie through your teeth it's fine that you're leaving the discussion because it's for the better. In fact, just leave the forum in general.

Niely - September 21, 2014, 8:56 am

^You really can't accept you're wrong.

The only thing you can do is attack people personal because you know you're wrong and can't find a good argument.

You're a real kid man, really immature; Just accept you were wrong! Or at least say something useful.

Feel free to flame in your next post as well, because you can't do anything better.
I'll ignore it anyway.

1. Scissor-switch membrane keyboard (the full name) does explain it's a membrane keyboard.
2. You have said yourself earlier in this thread that scissor indeed is membrane (that picture).
<http://i.minus.com/ie2UDlZqkiD6P.png>

Edit:
I'm out because Glitched can't accept he's wrong and keep posting the same flaming on and on.

>Ignores literally 15+ pages of information and arguments

>gets super off topic

>says he wins argument

I don't know what kind of fucked up school you go to but if you pulled that shit in school here you'd fail.

Aperture? - September 21, 2014, 4:45 pm

Just a note, I don't really get why you two don't just add each other to your respective ignore lists.
Your argument isn't going anywhere.

GL1TCH3D - September 21, 2014, 5:28 pm
