Thread: [\[TUT\] Funny way to temporarily disable a website](#)

WickedPunk - August 30, 2014, 3:05 pm

Hello my lovely HF users ?

Today ill be showing you a funny "exploit" you can say that i found in websites that are hosted by SPAM.com

Explanation on what the "exploit" is:
websites that are hosted by SPAM that don't pay for their "unlimited premium" data transfer, host ect have a CPU limit that when it reaches the limit it closes the website for a couple of hours (i think the owner has to do something in order to put the website back in air but i never tried this on myself)

Requirements:

Target to be hosted by SPAM.com

Hitleap account with a couple minutes (around 500)
a huge penis

Step one:

Login to your hitleap account and make sure you have a couple of minutes in

Step two:

Send traffic to the targets website with a duration of 10 seconds and the traffic source being Anonymous / Direct (if you have a lot of minutes and you don't want to spend all of them limit the total numbers of hit)

Step three: wait for your target to recieve the traffic and when its done go to the website and it will look like this:

This was my tutorial on how to temporarily disable a website hosted by SPAM :), if this method is already known i apologize for wasting your time but this is new to me and i felt like sharing this with people on HF, Good day ?

Basically DDoS the site by sending it traffic instead of packets, well, traffic is packets in a way.

This is not an exploit and this works on all sites if you have enough "traffic".

Could this work with jingling? Or is the traffic to slow?
