Thread: [Drivers / old drivers](#)

skilshotz - August 31, 2014, 6:20 am

Hi HF,

I got a question about drivers. Lately I've been fixing / reinstalling a lot of computers. Have found that some suppliers aren't updating their drivers lists for their devices which makes some drivers to cause BSOD's especially when I'm installing w7 on w8 computers. Do you guys know any efficient and fast way to find the latest compatible and fully working drivers for all the components of any device. I've heard all of those driver updaters are basically a scam. But if there would be one that would do the job fine let me know or any other tricks you guys know off ?

Thx in advance peepz.

When i'm updating drivers i normally follow the following method.

Spoiler ([Click to View](#))

1. Click on your start button (this is located at the bottom left corner of your screen).
2. Search for "Device Manager", once you find it you should open it.
3. Double click "Display Adapters" (this should show you your display device).
4. Right click on your display device and click "Update Driver Software". If you are prompted, click "Search automatically for updated drive software".
