Thread: [Hack past android password lock screens ?](#)

weedlife - September 2, 2014, 2:55 pm

Did not see what section to post this in so maybe it will get moved to proper location.

I have a samsung galaxy s4 mini which i forgot the lock password too, i know i can reset from by holding down the (up key, power button and bottom button) however i dont want anything to be erased.

Is there anyway to break in with software or via usb to my kali linux laptop ?

You'd have better luck asking this question in the [Android Operating System](#) section. You'll get more useful answers there.

This is not a hacking section. Post this in the Beginner hacking section or Android related hacking section. Please use the search feature next time.

I don't know if it's to hard to navigate around HF, but Nivarka is right go to Android Operating System section and ask help there ?
