Thread: [Temp Monitor](#)

[MVP] **MalRoto** - September 15, 2014, 12:04 pm

I was planning on making a program like Speccy but I got bored and side tracked.

Simple program that monitors your CPU temp (if supported) and alerts you if the temp (in celsius) is warmer than the limit you made.

You should really just paste source if the project is as small as this.

PHP Code

```
<?php
```

```
Imports System
```

```
Imports System.Management
```

```
Try
```

```
Dim searcher As New ManagementObjectSearcher("root\WMI",
```

```
"SELECT * FROM MSAcpi_ThermalZoneTemperature")
  For Each queryObj As ManagementObject In searcher.Get()
    Dim temp As Double = CDbI(queryObj("CurrentTemperature"))
    temp = (temp - 2732) / 10.0
    Label2.Text = (temp.ToString)
  Next
Catch ex As ManagementException
  MessageBox.Show(ex.Message)
End Try
```

End Try
```

I'll remember it for next time. Thanks

Also I found two other places with the same exact code.

Did you just copy/paste this?

I never said I coded it, I stated I was planning on making a clone of Speccy but lost interest. It is meant to just be a module/plugin for a project someone may work on.

Gasp - September 15, 2014, 2:13 pm

So its basically copy and pasted? I'm sure if someone needed this they could have found a source elsewhere.

Does it matter? He released it here. Since he didn't claim it to be his, I don't see the issue.

Yes it does matter. Why do we want a release of something we already seen hundreds of times? We don't need junk posting. We have enough of that.

The search function doesn't work for me, but when I use Google I see one release for a temperature monitor on hackforums. I don't see hundreds

You must be really bad at google then.

I find 100s of results.

Can you post a few from HF? If so this shouldn't be here, but my post says from hackforums
