What makes a UDP Shell better than other UDP Shells and why?

Very curious to know and learn from the answers to this question.

MineSQL - September 16, 2014, 7:39 am

This has nothing to do with PHP. Go post this somewhere else.

District - September 16, 2014, 4:18 pm

I'm not talknig about the power, I'm talking about the code. There are so many other shells but what makes them different other than the power, in terms of code etc and the way it works?

(Hence why I posted it here and not the booter section)

(Hence why I posted it here and not the booter section)Still, a UDP shell isn't coded in PHP. It is coded in a programming language like C or c++.

EDIT:

sorry, I am actually mistaken.

--

I don't actually work with shells all that often, but the attacks are generally all the same.

this one confused me. could you explain?

Isn't the code you execute in .php?

Nothing. It's the server it's hosted on that determines the power. And also if the shell is efficiently coded.
