Thread: [\[HELPING\] How to DDOS Someone \[HELPING\]](#)

CryptoGod - September 27, 2014, 9:17 pm

It has come to my attention that there are allot of threads that people post that are titled like these... "How to DDOS" "How do I DDOS someone" etc.

So I decided that, instead of wasting everyone's time making create threads, I am making this thread.

So, in this I will be teaching you guys(or girls) how to DDOS a person. NOTICE!*The following thread is intended for beginners to this type of thing(Booting, Dosing etc.) Therefore I will be explaining slightly simple and not quite so complex ways of doing so. I do know that there are ways out there that are of a much higher level than these methods, but this is for BEGINNERS!!!

So, method number one.

-----This is one of the most easiest ways of Dosing a person. You could just purchase a stresser online. You could also create one if you have the knowledge to create one(But hey, if you can create a stresser, that you shouldn't be on this thread anyways)

You could also(If you're a completely broke scrub who barely scrapes by in life, and has NO knowledge with computers at all!!!) Go into the Command Prompt in windows and use the... Ping command.

*NOTE! This method(as I said before) is for complete newbs at computing/hacking/Dosing/programming/anything that has to do with computers

Those are just two ways of Dosing someone(Also if you are planning on Dosing someone, I would suggest using a proxy server)

These are very low level I know, but It could make a huge difference in a persons life.

I hope I helped the HF community just that little bit more today,

Thank you for taking the time to read my thread,

Kind and best regards,

CryptoGod

I appreciate that you are trying to help, but your tutorial would not be of much help to most people. I will try to help you understand why.

Firstly, you said that they can buy a stresser online or they could make one themselves. But you did not go into any detail whatsoever about how to make one. If I were you, I would have maybe included the fact that they would need to purchase a server which can cost anywhere from 50-200 dollars a month, not to mention that most server renting companies do not allow DDOS software to be placed onto their servers, and will suspend your account if they find any.

Secondly, you did not make clear in your OP that the CMD PING DOS ATTACK DOES NOT WORK. That was known as the ping of death way way back, and it literally does absolutely nothing

now. People that attempt that are not scrubs or wastes of life. They are people that searched up DDOS online, and accidently read a really old tutorial.

I commend your effort though. Thanks for contributing to HF ?

I did not go into depth on how to create a stresser, due to the fact that I myself do not know how to create one. I just know that it is cheaper than buying one. I also didn't mention buying/renting a server because it did not occur to me to mention in the fact that I meant an online stresser.

Thank you so much for the concern, next time I make a thread like this, I will be sure to add in those details.

I consider myself more of a white hat, so I would not know into depth about the subject. I do however, the basics, and that id why I made this tutorial for begginers.

Thank you for reading,
CryptoGod ?

Bob White - September 29, 2014, 3:16 pm

Sorry but this "tutorial" is about as good as asking a 13 year old girl on the street how she feels about world events.

"How to DDos", Step 1, buy a stresser. I died a little inside when I read that.

You also do not include any useful info in the entire thread. It's like going to a mechanic and him suggesting you replace some parts but not actually telling you which or how, or where.

Turtle™ - September 29, 2014, 4:46 pm

So mean! At least he's trying to contribute to the community, and since the most common answer to "How do I DDOS someone?" is in fact, buying a stresser, that is actually a pretty valid answer :/

I value education over passing the buck. Think what you want. :)

Thanks for backing me up/supporting me man!

I am new to this whole DDOSing people so again I am sorry that I gave a pretty crappy suggestion for this subject. I do however(once again) consider myself more of a white hat than a black hat, so I do have very limited knowledge on the subject.

Cheers,
CryptoGod ?

0x03a8 - September 29, 2014, 5:12 pm

I'm happy to see that you're at least trying to improve the forums.

perhaps tell the users why one stresser is better then another and how to make a choice between them.

don't explain how to create a stresser, It's to complex (and expensive) for them.

CryptoGod - September 29, 2014, 5:16 pm

Thank you for the input. It is very much appreciated!

Next time I am making making a thread/post like this I will be sure do to so!

Also I will look into good stressers(I have no Idea which stressers are better tan others)

Cheers,
CryptoGod ?

r944614 - September 29, 2014, 7:54 pm

This is merely a Dos, I made the same mistake earlier, trust me. But you may help some people on the forums, well, if they have the spare time of course.

Suffering - September 29, 2014, 8:12 pm

At least he is trying to help put info out there. No buying a stresser isn't the same as DDOSing but it gives the same outcome.

Vile Soul - September 29, 2014, 8:50 pm

OP i like the motivation and effort but you honestly need to learn before you can teach. hop into the tut section and learn away dude.

Callmehellor - September 29, 2014, 8:56 pm

Slight correction: without slaves or multiple computers it is called a DoS, not DDoS.

Vile Soul - September 29, 2014, 9:01 pm

(Sep 29, 2014 08:56 PM)Callmehellor Wrote: [\[CITE\]](#) Slight correction: without slaves or multiple computers it is called a DoS, not DDoS.

Does not need to be computers. Simply machines or connections. you can have multiple connections on the same machine that just portions its power into sections and still call that ddos. I suggest referring to it as connections. vs computers or "slaves"

Actually, buying a stresser is practically the same thing as DDOSing. Except you are renting the servers instead of using bots, and there might or might not be more than one server, whereas you would need multiple bots to DDOS. You can think of a stresser that you purchase as a really strong slave if you wanted to.

Sedo - October 29, 2014, 6:01 pm

This is still a really good tutorial really love this for someone that needs to know this but to be honest allot of people know about it.
