So, I've decided to start working on a twitter brute forcer. However, I ran into a pretty big problem almost right away: I don't know of any module for HTML form interaction. For python 2, I would have used mechanize, but I have absolutely no idea what to use for python 3.

Thanks, but did you even read the OP? And I looked through requests, I'm pretty sure there's no form integration.

Do you need a twitter login in Python? Is that where you're missing out?

Dei be usin dem oAuths, mooon.
