Thread: [How to code a searcher in VB2010?](#)

iCumFire - October 2, 2014, 2:33 pm

Hey guys.. I was wondering how I could code a program in Visual Basic 2010 that you type something and it can like search google for you? If someone could help me out that would be awesome! My skype is iWillEndAll

GenericSkid - October 2, 2014, 3:50 pm

What my singleton mind came up with in 2 seconds:

Code `http://lmgty.com/?q=Change+the+URL+with+your+code+and+return+the+final+URL+`

I mean, lmgty.com does exactly what you said. ("can like search google for you")

Well, you could use this:

Code `Dim URL as String = "https://www.google.com/search?q="`

`Dim query as String = "peanuts"`

`Process.Start(url & query)`I think that would work.

You could use [this](#) Google API but it's very limited.

This is really a cool searcher. I build my one with my own preferences after downloading the source he gave for free in his thread.

I have a picture off my Searcher on Page 3 of the thread, but with a little editing you can search anything you want, not only sources.

Thanks to Only3:

I managed to get some pretty decent search results with this code. Only a few lines of code without the use off the google search Api.
