Thread: [How to make an auto-typer with VB](#)

exzionex - October 4, 2014, 5:34 pm

Hey guys this is a tutorial on how to make an auto typer with VB.

Anyway guys these are all the codes needed for this tutorial...

Codes:

(Dont copy the {<<<})

```
Button1_Click  
Timer1.Enabled = True
```

```
Button2_Click  
Timer1.Enabled = False
```

```
Timer1_Tick  
SendKeys.Send(TextBox1.Text)  
SendKeys.Send("{Enter}")
```

```
Radio Button 1  
Timer1.interval = (1500) <<<Change to what you want  
Timer1.interval = (1) <<<Change to what you want
```

Ok guys so lets get on with this.

- 1- Goto File and make a new project.
- 2- Select the Windows Forms Application. (Name whatever you want)
- 3- Add two buttons, one timer, and a textbox, and two radio buttons then put them how you want them to look.
- 4- Once added double click everything added and put in the code from above accodringly.
- 5- Once done make sure to press the play button to test it out.
- 6- If all works out well make sure to save it.
- 7- Then go to the visual basic folder and get the application you got from the test and use that one as it it the actual application you can just click and use.

Well guys if this is not clear enough for you please pm me or comment and I will make a video putting this into more detailed explanation.

So guys I will tweak this as much as I can to make more sense if it doesnt for some reason.

My Auto-Typer for anyone who is interested.

It's nice to see you try giving to the community, but this is almost so simple that everyone knows how to do this. Perhaps add more methods and options for the autotype?

For example, try to make it only type when a certain window is active. Let the user customize more on the WinForm GUI.

Everytime you release a product to HF, you need a Virus Scan man. And since you're releasing the code, why not the source?

If you're looking to make a beginner tutorial, I'd suggest going over the most commonly used methods and classes. With that information, a user who actually takes the time to read the tutorial (if well written) should be able to take all the knowledge away from the reading that they will need.
