Thread: [How do YOU protect yourself](#)

ThePetty5 - October 9, 2014, 1:53 pm

Hay community,

I just want to check out how the most of you are protecting themselves while doing illegal stuff in the world wide web.

I don't expect anyone to tell me.

But this question always seems very interesteing to me.

Maybe I will tell you how I am protecting myself online, too.

?

Nakamoto - October 9, 2014, 1:56 pm

It's best not to tell anyone how you do the things that you do.

ThePetty5 - October 9, 2014, 2:02 pm

I don't want to know which specific vpn, socks5, firewall or other kind of encryption you use.

I'd just like to know whether you use anything of this or not.

Is it unessecary to use this much protection in your opinion or wouldn't you even use any internet browser without knowing your that you are safe as f****

ryderstorm - October 9, 2014, 2:08 pm

Using public wifi hotspots helps.

?

It's necessary to use protection whenever you do anything illegal. Barebacking with the Internet is a horrible idea.

Bob White - October 9, 2014, 2:13 pm

Public/stolen/cracked wifi, stolen/hacked vpn clients, socks5, and/or those paid for in bitcoin.

kill switch on a usb stick with a hotkey.

detracing, fake doxes, and a few in real life tactics to avoid being tracked by conventional methods.

yada yada.

SIM-2053312 - October 9, 2014, 5:46 pm

Reverse proxy from bots could be good but it's not safe writing these things on public forums imo

crazyycast13 - October 9, 2014, 6:08 pm

Look around the forums for ideas if you want to protect yourself

enae - October 11, 2014, 3:17 am

using custom vpn, and of course public wifi :)

SpaceKase - October 11, 2014, 3:24 am

Custom VPN running off VPS paid for with bitcoin, TOR, Live-CD or separate windows VPS paid for with bitcoin, fake doxes (leave long trails to nowhere).

Don't talk about your business with anyone you can't make face the consequences afterwards.

Don't do illegal things?

a323109 - October 11, 2014, 7:33 am

First of all i dont do illegal things.

But if i am going to do something which requires additional protections i'll do this way.

When i am abroad like in sudamerica or somewhere i buy a smartphone under false name. Like....Mohamed Moham born in Syria in 1970 ecc

I want it with international roaming, once i'm at home i extract the sim, put it into a modem i have, connect it to a laptop with no operating system installed, boot a live operating system with read only filesystem and start to whatever i want.

At worst police can reach "Mohamed Moham born in Syria in 1970" but Mohamed does not exist.

When i shutdown my laptop the live system doesnt leave any clue.

8 to 10 years ago I've done piggyjacking. This term is not used, but is hacking only for the pleasure of penetrating and nothing more; no harm or change on the target. Now I abandoned but remeber how to don't leave traces. VPN + socks + mask Mac wifi/ethernet and hdd + change name of computer. Some of this things I do not remember the DOS commands ...

Tokyo ? - October 11, 2014, 1:30 pm

I actually tend to use a condom. Usually protects me... Most of the time... (;

JaimeLannister - October 11, 2014, 4:09 pm

I'm a big privacy advocate- people have a right to privacy and I feel that protecting yourself is not just for committing crimes (why should I have to deal with that sense that big brother is watching?). I would recommend Tor to most people (especially those with a limited knowledge of how the internet

works in regard to privacy) b/c it is free and easy to use, but some sites won't let you connect to them through the Tor browser. In those instances I'd recommend a VPN+SOCKS5 (you could also use a cracked proxifier and throw SOCKS on Tor). And VPNs, while not free, are pretty cheap (just make sure it doesn't keep logs etc or you could just be essentially changing who watches you) and easy to connect to. You could also use putty to create an SSH tunnel to a VPS to create SOCKS proxy (this will also allow you to escape censorship if you are in a country that blocks certain websites); there are also other, more complex combinations of the above.

Centuries - *October 11, 2014, 4:11 pm*

1 proxy vpn and some scripts
not much but for what I do works
