Thread: [Binding rat to image or whatever instead of binding image to rat possible?](#)

mcfaker - October 13, 2014, 8:14 am

Hey,

Everytime you build a server you get the option to bind a file for ex. an image to your rat. When the file is binded for example an image on darkcomet, after building the server you always get an ".exe". Now you cant change it to a ".png/.jpg" because otherwise it wont work right & spoofer dont actually change the extension they only rename.

But isnt there a program which can bind 2 files "image.jpg" with "virus.exe" and make the final file ".jpg" so when you click on the image the binded virus will be opened next to the image file?

Thanks in advance!!

kenkas12 - October 13, 2014, 8:17 am

JPG OF DEATH work only on un patched win xp
i believe there is private exploit for win7

tux1 - October 13, 2014, 8:22 am

No, what ever you bind the file with it will always be an executable. You can use extension spoofing to mask the filetype but this is only a naming trick.

Gunter The Penguin - October 13, 2014, 8:23 am

No, but you can put .scr instead of .exe and it will still function the same.

mcfaker - October 13, 2014, 8:55 am

Thanks guys, what about java driveby's are there still any fud ones? & isnt there any method in which the user just goes to a website which will automatically download & install without asking permission?

If you have more questions next time about Remote Administration Tools then post it here:

you can do a self extract so it will look like an image and when the victim double click the file the image will be display first then the .exe will be installed

what he said

DirtyDiesel - October 11, 2018, 7:35 pm

modified form of steganography, you could mask it but it wouldn't be all that practical. The execution part is always tricky with images and RATs

CyberStrike - *October 11, 2018, 7:38 pm*

2014 ... geez, and yes you can include a payload not your traditional exe into an image generally a polyglot.
