Thread: [\[SimpleDownloader\] Source code - Give away\[SimpleDownloader\]](#)

jcbullet - October 15, 2014, 3:14 pm

Evening people,

Another release ive got, A simple silent downloader.

{#} Checks for Admin/User, Adds to start-up accordingly to the admin result.

{#} Copys Itself once run to a folder it creates in application data, sets the startup reg key to run from here.

{#} Downloads the set exe and runs the file.

#####

Downside is that you have to always have the same hosting.

The name has to remain the same of the exe.

#####

Upside, Its completely fud as it is, Even with the registry mods.

The downloader will download your exe upon reboot. So if botkilled, then your exe will download again and run once again.

#####Please note#####

This has only been properly tested on VM XP SP2, i don't particularly want to run it on my personal machine and dont have a windows 7 machine around.

#####Creating folder on first run, Proceeds to download the exe and save it to the folder#####

#####Picture shows the downloaded exe on right in c:\windowsservice\#####

#####Picture shows copied downloader exe to appdata windowsservice#####

Currently on compile 9.5 KB

It has no error handling just blank/do nothing bits.

<http://v2.scan.majyx.net/?page=results&sid=227476>

#####0/35#####

If anyone thinks i should release it please let me know.

Cheers.

Is no one interested in this? Maybe any thoughts in how to make it better?

You may want to look into virtual machines, like VirtualBox or VMWare.

I wouldn't say that nobody is interested in the program, it's just that there are countless downloaders. Literally every other C# post is a downloader or RAT. So I would say that if you want to grab attention, come up with a new idea.

But it does seem like a good program.

An idea: If the file you're downloading is .NET make it download the file in memory and invoke it into the same process

Yeah ive got the class for it but i dont know how to invoke the runpe

`cmemoryexecute.run(byte array , string hostprocess, something)`

you have any experience in it atall?

nonmanaged can be injected into vbc i think
