Welcome to Electrolytes Darkcomet 5.3.1 Set-up Guide

This guide will go through the following things.

Downloads

FAQ's

Set-Up

Trouble Shooting

Resource's

Portforwarding

First off, For those of you who are new to RAting you might be wondering one of the following questions.

Q:What is a RAT?

A: A RAT is a Remote Administration Tool,

Q:What can a RAT be used for?

A: A RAT can be used for many different things, that being gathering information on a person or there computer or surveillance. as well you can read through the managers below for a more detailed idea.

Managers:

File Manager

Process Manager

Service Manager

Device Manager

Window Manager

Registry Manager

Installed Programs

Active Port list

Spy:

Screen Capture

Webcam Capture

Password Recovery

Keylogger

Audio Capture

Network Tools:

Socks 4/5 Proxy

HTTP Proxy

Send File  
Download and Execute  
Open Webpage  
URL Redirection

Other

Quick Search (for logs)  
DDoS Prompt  
Extras (open-close CD-ROM etc.)

Well before we get into the full tutorial. you might want to consider downloading the following software's.

No-IP DUC 3.0 or higher which can be downloaded from [HERE](#).  
DarkCometRAT 5.3.1 which can be downloaded: [LINK REMOVED] - Mediafire deletes the rat as soon as its uploaded, If you wish to get a private DL link Private Message Me on here.

As well before we start with the set-up, you should go ahead and disable the following AV on your computer. In order for the RAT to run on your computer you need to disable AV because it views the file as a Remote Administration Tool Builder.

Microsoft FireWall  
Windows Defender  
(Any other personally owned AV protection)

Now for the set-up of your Remote Administration Tool!

1.) First you are going to want to go to this website: <http://noip.com/>

Here you are going to want to register an account and head to the manage host's page which can be located [HERE](#). (Make sure you are logged into noip.com when you click this)

From here you want to create a new host, For this tutorial I will be using darkcometrat531.no-ip.org  
<http://prntscr.com/2mn5yn>

2.) Once you have your host name set-up you want to move over to the noip DUC 3.0 you downloaded at the beginning of this tutorial.

Once opened you want to login with the same credentials you used on the website to create your host. <http://prntscr.com/2mn6k2>

Once logged into the DUC you will be prompted with this screen <http://prntscr.com/2mn6xu> From there you want to proceed and click on "edit hosts" once clicked you want to click the check box beside your hosts name and click "save". Once you hit save, you should notice the two status's that were marked with a red "x" are now both checked with a green check mark.

3.)(If you already know how to PF and are ported please proceed to step 5.)  
Port Forwarding, Now don't get me wrong to some people this might seem challenging and impossible to do. but really it isn't. to begin you want to visit this website: <http://portforwarding.com> go to the router page and look up your router model out of the page of router models. Once you find it there will be a full tutorial on how to correctly port forward on your router.

4.)If you are like me you can go to CMD and type "ipconfig" into the prompted window. this will come up

Wireless LAN adapter Wi-Fi:

```
Connection-specific DNS Suffix . : Home
Link-local IPv6 Address . . . . . : 0000::60ef:2528:2c34
IPv4 Address. . . . . : 192.168.1.???
Subnet Mask . . . . . : 255.255.255.0
Default Gateway . . . . . : 192.168.1.254
```

You will want to go onto your web browser and input your "Default Gateway IP" and it will bring you onto a webpage for your router or it will bring up a prompt screen that will request a login from the admin. Which i am sure you all should know your login to your router if not you can call up your ISP and have them manually reset your router to factory conditions.

From this point you will want to port your IPv4 Address as well as to the port: 1604 (default port used by DarkComet RAT).

5.) Once you are done port forwarding you can continue to open up the DC rat accepting the EULA and proceeding to the "Listen to new port" tab which can be located here. <http://prntscr.com/2mn9k2> \_don't mess with anything there unless you plan on using a different port. If not just click listen, if you ported correctly you should now be able to go to

<http://canyouseeme.org> and check 1604 and it should be open.

if not you either messed up on PFing or your AV is blocking the connection. If it works congratulations! you have officially correctly setup your dark comet rat, now all you have to do is build a stub using port 1604 and your Host you created in NO-IP and you are DONE! you can test your stub at <http://anubis.iseclab.org/> or have someone on HF do a install for you.

I hope this has helped some new users, I hope it will be put to good use.

thanks,

-Electrolyte

**ExC Fearsome** - October 21, 2014, 2:16 pm

Already see a mess up. No-IP is no longer used as Microsoft now owns it. They are catching ppl a lot more. Might wanna update this buddy

**Flaxman** - October 21, 2014, 2:32 pm

I don't really know if another tutorial is needed, if you make one with a video, it would be a hell much better! Btw, nice guide though :)

**Khamul** - October 21, 2014, 2:59 pm

There are already 1000000 tutorials but great to see that you genuinely want to help the community! And like a previous post said, don't mention no-ip!

**Incognito™** - October 21, 2014, 4:38 pm

Your assuming rats are only used for black hat purposes. This is not a tutorial on how to hack other people its a guide to set-up darkcomet. What you choose to do with the rat is on you. Don't assume shit.

(Oct 21, 2014 02:59 PM)chertycherty Wrote: [\[CITE\]](#) There are already 1000000 tutorials but great to see that you genuinely want to help the community! And like a previous post said, don't mention no-ip!

Of coarse I knew that, This was an update thread to mine that I posted about 6-12 months ago. This is just to repost it as it's against HF's rules to a thread that is older then a certain date. Please if you wish to comment on something see the good in the thread not the bad. Regardless if a billion other tutorials have been posted its men't to help users.

-Electrolyte

**StayZoned** - October 27, 2014, 12:19 pm

Nice tutorial, easy to follow and detailed. thanks

**Water Aura** - October 27, 2014, 12:42 pm

Awesome tutorial, keep up the good work.

A tip though, use img tags to show the image rather than linking it to another site.

**Incognito™** - October 27, 2014, 6:02 pm

Thanks for the tip, but I already thought of that. Unfortunately I cant IMG tag a prntscr or else I would off. Plus I was lazy and didn't feel like re taking the pictures with another img software.

**ThCannabis** - October 27, 2014, 10:30 pm

What should be used instead of no-ip?

**Incognito™** - October 27, 2014, 10:34 pm

(Oct 27, 2014 10:30 PM)ThCannabis Wrote: [\[CITE\]](#) What should be used instead of no-ip?

It depends on what you plan on using the RAT for, If you plan on using it for "bad" intention I suggest buying VPN / VPS and running it off that. If you plan on using it for surveillance and or monitoring your children so to say. You are fine with dyn.dns / no-ip no difference.

-Electrolyte

-ElectrolyteWhat about a free one such as [froot](#)?

**Incognito™** - October 27, 2014, 11:17 pm

(Oct 27, 2014 11:11 PM)ThCannabis Wrote: [\[CITE\]](#) What about a free one such as [froot](#)?

I wouldn't suggest using a free one because they may also send samples like no-ip I suggest buying a VPN / VPS off a trusted legit user on here.

If I were to recommend anything it would be: <https://hackforums.net/showthread.php?tid=3951528>

(143VPN) They currently have a sale on for 25\$ for lifetime subscription to their vpn.

-Electrolyte

**JaimeLannister** - October 28, 2014, 4:42 am

so if I have a vpn already and I am using it to monitor my kid then I should use that? what I don't get though is this: do you have to use something? if just using it for purely ethical and legal purposes why do you need to mask your ip at all? Just wondering if this is a requirement to make darkcomet and or other RATS work...

**Oliver Sykes** - October 28, 2014, 8:15 am

Well, even if it is legit traffic, no-ip will still ban after a period of time. A good alternative would be [Freedns](#).

Besides that, great tutorial.

Also, when you click the prntscrn links, just right click them and click "copy image url". It'll give you an imgur link which can be used with the tags

Here, I've got all the image tags in order for you. You can copy and paste the tags and links and replace the prntscrn's. ?

Spoiler ([Click to View](#))

[img]http://img59.imageshack.us/img59/3169/8lhn.png[/img]

(You didn't mark out your ip on this one... Why is it imageshack? Weird)

[img]http://img89.imageshack.us/img89/8655/6lr3.png[/img]

Thats a VPN IP, As well this picture was taken about a year ago. so the chances of me re-using this

IP is astronomical.

Thanks tho,

(PS. I will update the pictures when I get home I am out doing something atm.)

-Electroyte

**fagswagger** - October 28, 2014, 9:09 am

Nice rat, i can vouch for its legitness :D!

**Oliver Sykes** - October 28, 2014, 10:15 am

Ehh, not sure. I've had the same ip for a couple years now, but I set it to static a while ago. I guess most people use a dynamic ip.

**Incognito™** - October 28, 2014, 3:40 pm

(Oct 28, 2014 11:51 AM)Lalit Agarwal Wrote: [\[CITE\]](#) OP i appreciate your work but your tutorial is of no use there are lots of tutorial on same think and better(detailed) then yours.

You have just wasted your time, instead of making a tutorial on DC you could have choose some other RAT or a different topic.

In this world 99% peoples use RAT for illegal use & you know this very well.

And there is no such kind of rule unless it's on topic.

Grave digging is defiantly not allowed. and as I said I don't care if there is 10 million tutorials. Besides this was an original post I made about 9 months ago. as then people still could figure shit out. I am not seeing your need to be ignorant and tell me facts I already knew. The post is to help people, I don't care if it only helps one person. Its something I felt should be re posted so others can see and use it.

**WolfHD** - October 28, 2014, 6:24 pm

its good to see a real download of DC here again ! Thanks

**Incognito™** - October 29, 2014, 9:40 pm

I'm quite confidant that that IP will never be linked to again, seeing as to how I have switched IPS in the past year and also have replaced my router. Besides My internet provider has DoS protection up to 100 gb/s so I'm not to worried if someone attempts to hit me offline. Also on that note the ISP can back trace the IP to where the stress came from and if its a HF users stresser I can simply ask him to check the logs for anyone that has hit this IP in the past while then I could make a report or what ever procedures need to be done in cases of that sort.

**darkvas** - April 5, 2018, 5:51 am

Thanks for the tutorial,confused over the no ip stuff thugh

**hydrophobic** - April 5, 2018, 6:35 am

(Apr 5, 2018 05:51 AM)darkvas Wrote: [\[CITE\]](#) Thanks for the tutorial, confused over the no ip stuff though

This thread is 4 years old.

And, NOIP in 2018 for ratting is ironic

Try leetdns or freedns or just set up your own dns like me, cheap domain is all you need

**Anubis** - April 6, 2018, 12:37 am

Wow, good job for brinigng up 3.5 year old thread guys.

**x222** - April 6, 2018, 11:54 am
