Very generous of you to help out learning users! Okay so this may seem pretty basic but if I were to go buy say the jSpy RAT I would download the program and then what? Would it provide me a link to give to people and if they click it I can use the RAT or am I given a file for them download? I'm a little confused how that all works but I understand the basics of a RAT just not how it's actually spread and what is actually being spread.

Thanks for your time!

i have a laptop i am trying to keep a rat running on, but everytime avg detects and removes it.

ive even tried adding exceptions to avg so it bypasses the file but it creates a conflict on the laptop and nearly freezes it for some reason,

i have tried two crypters so far and no joy, any help much appreciated
