Thread: [How to Create a Ping](#)

xxGelonpetronXx - November 24, 2014, 7:53 am

OK! First we open the Visual Basic 2010.

We put Windows Forms Application and as the name Ping IP.

Now follow the steps!

Take 1 Button 2 TextBox.

Click on Forms and Let's put this code just above Public Class:

PHP Code

```
<?php
```

```
Imports System.Net
```

Now click on the button and in the Click event we put this code:

PHP Code

```
<?php
```

```
Dim hostname As IPHostEntry = Dns.GetHostByName(TextBox3.Text)
```

```
Dim indirizzo As IPAddress() = hostname.AddressList
```

```
TextBox4.Text = indirizzo(0).ToString
```

Now We initiate the Debug and you're done!

More Simple :

Code Imports System.Net

Public Class Form1

```
Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
```

```
    If My.Computer.Network.Ping(TextBox1.Text) Then
```

```
        MsgBox("Server pinged successfully.")
```

```
    Else
```

```
        MsgBox("Ping request timed out.")
```

```
    End If
```

```
End Sub
```

```
End Class
```

OP doesn't even know what his code does. That's not "pinging an IP".

AimBRoT - November 24, 2014, 8:21 am

Every1 on HF should know how to Ping ... but okay thanks ^^

So I assume you know how to ping in every single programming language in the history.
