Thread: [Infecting a computer when they visit a website...](#)

HappinessIsKey - December 2, 2014, 3:04 pm

Now I already know how to code html, css, javascript please don't say I need to go learn programming before I do this... I just want to know where I can go to learn further into this field as exploitation is my favorite form of hacking :) thanks.

Otis??????????????? - December 2, 2014, 3:30 pm

I think you are referring to a JDB (Java Driveby)

Well I heard JDB were outdated I was wondering if I could learn more about shells? I have no idea what those are but I would like to know more about them

w34k - December 2, 2014, 5:20 pm

It's pretty simple to do.

Shells are what inject/upload into to a website when you want to deface it and or execute commands as root. If you want an alternative to JDB, try looking into Silverlight or Flash exploits etc.

Alot of things are outdated but still work. Why? because people are ignorant. If you wan't to shell a website. Learn web vulnerabilities. I'd start with SQLI if I were you. Here is a compilation of webhacking tutorials. use it well <https://hackforums.net/showthread.php?tid=2008347>

as w34k said though, check out silverlight exploits, flash exploits and newer java exploits. Good luck.
