Thread: [The TTDN Project \(Rat's through I2P and TOR\)](#)

Jeff_The_Killer - December 9, 2014, 9:12 am

=====

Okay so I had this idea instead of VPN's, Use Tor or I2p instead of the overused VPN's and all that, I want to try something new and make it completely(almost) anonymous and not traceable I will be posting all my findings on this here if you want to help download I2P router and Tor then start by trying to run your rat's through them and even try implement it into your rat's. Report your findings here.

=====

Update:

I am now getting a I2P web server host For testing with PHP Bot's/Rat's and for the main information site for this project please be noted I do not guarantee the site will be up 24/7 as of using a free hosting solution

I will be testing KazyBot at first I am using the trial version because of money restrictions.

if you would like to help out with those money restrictions you may donate to my Anoncoin or Bitcoin address, Anoncoin is preferred but not required, If using Bitcoin try to launder your coins first and stay safe

if you would like to use anon coin for donations you may get it from <http://anoncoin.i2p> and if you would like to use Bitcoins but do not yet have a wallet yet for Bitcoins you may get one from

<https://bitcoin.org/en/choose-your-wallet>

=====

To get i2p and tor please read up on this I do not want anyone to compromise them self's I want you guys to keep safe and out of trouble I am here to help us these links

====I2p & Tor info====

<https://thetinhhat.com/tutorials/all.html>

<https://blog.torproject.org/category/tags/tor-network-safety> (Tor can be unsafe because of end nodes that where taken over by the FBI be careful.)

=====

====I2p and tor downloads=====

<https://geti2p.net/>

<https://www.torproject.org/>

<http://sourceforge.net/projects/advtor/>
