Thread: [Is it possible for a variable inside of a variable?](#)

Topkek_Is_Life - December 9, 2014, 2:01 pm

I'm pretty rusty with batch and am looking for a way to do this or a way around it.

The script is

Code set var%setnum%= %str:~!str1!,!str2!%Where %setnum% is equal to 1, %str% is equal to the alphabet (ABCD...), %str1% is equal to 0, and %str2% is equal to 1.

so that it would display like

Code Set var1= ABCDEFGHIJKLMNOPQRSTUVWXYZ:~0,1That way if I were to echo %var1% is would display "A"

You want the variable's name to correspond with a letter of the alphabet?

Code setlocal enabledelayedexpansion

set str=ABCDEFGHIJKLMNOPQRSTUVWXYZ

for /l %%A in (0,1,25) do (

set /a num=%%A+1

set var!num!=!str:~%%A,1!

)

When you're storing a variable, you're storing the actual value of the variable and not how to get the variable. It will expand that entire line, and then perform what it says.
