Thread: [using a RAT with LAN connection](#)

GeForce16 - December 12, 2014, 2:16 pm

Hello, I need a RAT program that will be able to connect and infect other computer in LAN, What RAT would you recommend to use? And how do I infect other computers ? I know I can use Hamachi and I already set that up, The computers I want to infect are connected with Hamachi.

I tried using Ceberus RAT at first, But I couldn't understand how can I connect it using Hamachi, Can somebody give me a good tutorial or at least a nice explanation on how exactly can I rat LAN with Hamachi?

Edit : I will not need port forwarding probably, So what do I need to do with port listening ? And do I need to infect other computers by opening up the server file ?

I would recommend that you use Bozok RAT, and set it up on your localhost: 127.0.0.1

Thanks for the RAT, It works, Although I had to use Hamachi instead, for some reason the LAN didn't work, Maybe it's because my computer is logged by Ethernet cable and the rest are connected with WiFi (With USB antenna)

Anywas, The RAT is great, If the price was lower I would've purchased it, it's just great.

Thanks !
