Thread: [Botkiller](#)

?!??? ??t - December 16, 2014, 7:25 am

hi there

i saw this "botkiller" on a other forum

Code Func botkiller()

RegDelete("HKCU64\SOFTWARE\Microsoft\Windows\CurrentVersion\Run")

RegWrite("HKCU64\SOFTWARE\Microsoft\Windows\CurrentVersion\Run")

RegDelete("HKLM64\SOFTWARE\Microsoft\Windows\CurrentVersion\Run")

RegWrite("HKLM64\SOFTWARE\Microsoft\Windows\CurrentVersion\Run")

FileDelete(@StartupDir & "*.*)

EndFuncbut it looks pretty bad

is there a better way in autoit ?

Thanks

If the Opposing malware has registry persistence, It won't work.

Maybe the WinAPI can help you.
