Polymorphic survey locker

Hello everyone, while I was outside for a walk, I thought about this project: to code a free survey locker with these features:

- Polymorphic data encryption algorithm to encrypt the hacker's data
- Reverse proxy to navigate to the survey's url in anonymous way
- Startup + persistence
- encrypt all the personal files, asking for the survey completion to decrypt them
- Try to bypass UAC
- Date activation
- Folder lock
- Stealers.

How to start the project

I'm already able to code all the things that are aforementioned, but i need someone that can advertise my product, a guy that is able to draw a nice thread and a guy that can design a logo. I also need to know how many of you would approve this project, so i ask you to complete this strawpoll ticking it USEFUL or UNUSEFUL.

If we reach the number of 50 USEFUL, i will start to code it right now.

Poll: <http://strawpoll.me/3260880>
