Thread: [\[Help\] How to Bypass CloudFlare 5 Seconds DDoS Protection Under Attack Mode](#)

SimpleOne - January 1, 2015, 7:54 am

Please someone help me bypass Cloudflare DDoS Protection Circle 5 Seconds, because I can't attack with XML-RPC or Joomla on Layer 7 and it's absolutely useless for their Premium packages Of CloudFlare.

Someone please tell me which is the method of layer 7 can bypass CloudFlare DDoS Protection 5 seconds as in the picture on below (link)

imgur.com/4KXnNCt.png

Also I have tried brute-force most of the website subdomains, actually it will not work for those HQ Websites because it will give me the localhost (127.0.0.1)

imgur.com/Ka4gfrX.png

Please give me a discount for this special method on l7, thank you for reading.

That's "I'm Under Attack" mode, not "5 seconds"

You need the backend IP for XMLRPC or Joomla to work. Register on the forum and check the headers for the welcome email or put an IP logger in your signature/avatar.

mail.ugbase.eu resolves to 178.33.33.28

SimpleOne - January 1, 2015, 8:01 am

The target has avoided this as you said the Iplogger he removed that part for not get the Real IP, That's why Layer 7 will be always the best for HQ Websites so we don't need to know the real IP. If you want test their security check the forum

Link:(I am not authorized for it): ugbase.eu

There is no 'special method'

I have a 2K XMLRPC list and can't attack CloudFlare sites without the backend IP. I'm Under Attack mode automatically blocks all L7 attacks on the URL. What do you mean he avoided the IP logger? He banned one IP logger or it doesn't work on this particular forum? You should still be able to check the email headers.

Edit: (sender IP is 178.33.33.28) smtp.mailfrom=mainmail@ugbase.eu

The IP logger works, I don't know what you were talking about... 92.222.169.204

Try XMLRPC/Joomla with http IP

SimpleOne - January 1, 2015, 8:09 am

Edit : Lol the OVH services, I don't know the method for now but previously i did attack it on SSDP.
So this is the Current IP 92.222.169.204?

Oh I see it's OVH. You usually have to pay for that method.

I managed to bring it down with SSDP on 92.222.169.204

SimpleOne - January 1, 2015, 8:55 am

Thanks for the method on PM , please send me PM how i can bypass OVH services.

Hydra. - January 2, 2015, 3:10 am

I can take it down for you. ?

Just pm me and we can speak about it.

SimpleOne - January 2, 2015, 6:16 am

Sent You a PM, Check it, Thanks for your reply :)
