Thread: [Imminent Monitor and ByteCrypter, not loading on startup!](#)

anonymous200912 - January 1, 2015, 9:50 am

Making a basic server with Imminent Monitor (payed version), entering all my IP Details and Port details ect, not using IM startup options.

Basic settings which would affect the server:

I then FUD it with ByteCrypter (payed version) and enable the startup install with randomly generated folder name and file name, I Crypt the server with a fake error message, and then use the Obfuscator to protect the code further.

Settings:

I open my server on another of my computers, all works fine, it shows up in my client. But then after restart the server no longer shows up in my client.

Any ideas why ? Used to work fine!

One sec. I have this setup. I'll try out your settings. It could be because both the RAT process and the crypted process are critical.

And it is svchost not svhost.

Winry Rockbell - January 6, 2015, 6:30 am

You activated on both, IM3 and Bytecrypter, Startup. Disable it in IM3. And please read the .pdf from Bytecrypter lmao.

?Genocide(X) - January 6, 2015, 6:36 am

As Konata said disable it on IM3 use self injection. Take off that Fake message will spark Malwarebytes, take off single instance, check PEB.
