Thread: [Auto run from USB drive](#)

alolfail - January 1, 2015, 3:40 pm

Hey folks..

I've investigated a bit and tried finding a method of a quick connect-disconnect a USB drive infecting method and couldn't find anything, what I did find was this:

1. Autorun.ini cannot auto run an executable.
2. There is a registry key modifying the above, but it is possible to modify it only with a bat file according to my knowledge, and if I could have ran a bat file it would be easy.
3. I need help from you guys ;)

Any suggestions?

Thanks.

Are you trying this for your own computer, or for some "quick-put-this-trojan-while-friend-is-in-toilet"? :b

I heard some things about U3 usb keys that you could modify to make them appear like a cd-rom to the pc, hence make it execute a program automatically without that silly window we all know to appear... Not really sure 100% about this though.. to verify.

Or da best way is to buy THE Rubber Ducky, google it, youtube it, whatever-you-want it this thing is THE fcking tool to possess ? (bit expensive though). It's basically a usb key which appears as a keyboard and types super quickly a script (written by you) as soon as you plug it in.

Finally you could look a bit around the recently discovered "BadUsb" vulnerability found in most of usb devices, its rocks but it involves deep hardware knowledge and I find it difficult to understand.

Cheers ?

Look into Teensy, Rubber Ducky, or BadUSB. Links and info can be found here.

Well it's for educational purposes only.

Thanks guys, Appreciated!

I will update the thread when I'll get home and try.

USB Rubber Ducky seems to work best -
