Thread: [Bacon-Ipsum-Component | Enter and manage placeholder text super easy! BACON STYLE!](#)

Tasemu - January 5, 2015, 10:08 pm

Intro:

Here is another little project for you people to use as you please. I decided to make this because I was getting tired of going to lorem-ipsum constantly and copy/pasting placeholder jibberish into my templates. So I made this component which I believe has a few cool tricks to it that can help your development workflow:

Use one tag to generate any placeholder paragraphs you need

Dont need to copy/paste anything

Takes up a lot less room than a wall of text in your markup, its only 1 tag

Bacon goodness

How to install

The component is super easy to install with bower. Just run the following in your project directory:

Code `bower install bacon-ipsum-component`
and then include the import anywhere in your header like so:

Code `<link rel="import" href="/path/to/bower_components/bacon-ipsum/bacon-ipsum.html">`
Thats it!

Usage

The Bacon Ipsum Component is hella easy to use. Simply find an area in your markup, for example:

Code `<div class="my-area">`

`</div>`

and then copy in the tag like this:

Code `<div class="my-area">`
`<bacon-ipsum paragraphs="5"></bacon-ipsum>`
`</div>`

Notice you can pass in how many paragraphs you would like to generate in the 'paragraphs' attribute. If you do not put in a paragraphs attribute then it will default to 2 paragraphs.

Contribute

Feel free to pull the code from here and do whatever you want with it. If you make it better then why

not commit a pull-request?

The lack of bacon related replies is disturbing.

Bacon is the #1 tool in any web designer's toolbox. Thanks for this meaty goodness! (Which is incidentally, I'm sure, the name of someone's dick.)
