How to spread keyloggers, RATS.. Anything, via sex-chat's

Step 1.

First we need to find a sex-chat site. I've choosen "isexychat.com" this site is good because it bans you by your ip if you get caught, so you can change your ip. Also on this site you can set if you are a woman or a man, you're gonna pick woman for this method to work. Then set your name as "SexyBabe22" or something like that.

Step 2.

Now write a message in chat like this:" Hey boys, wanna see my nudes.. pm me ;)" then after 30 seconds you will get bombarded with messages, then make a fake message like this:"I have my nudes here.. "your malware dl link" also use a binder or crypter or something like that to hide your malware as an img file, or anything like that, so it doesn't get to suspicious. Then copy the message with link to the clipboard so you can paste it quick

Step 3.

Success! just wait for all the new computers to be added to your botnet, Rat server, anything..

Skype spreading is a lot easier then posting links hence most chat sites block some URL's which minimizes the execution rate.
