It's not the best way but it's a way.

Please explain why you set userlist as php file when it doesn't do anything related to php (same as for the stafflist)?

also what about the check...

if \$_GET['hwid'] doesn't exists it will give a warning: GET index not found....

You'd want to do this before:

PHP Code

```
<?php
$hwid = isset($_GET['hwid']) ? htmlspecialchars($_GET['hwid']) : null;

//before you add the hwid check it with an if statement:
if($hwid != null){
    //Add HWID
}else{
    echo("HWID not found!");
}
```

thanks for the feedback!

i forgot to change the .php back .txt as for some reason .php only worked on my ftp server (its free hosting)

as for what you added i will be using that the next time and i understand its not the best way and your right it is a way, i just started to learn integration with php, im going to try your way next time :)

again thanks for the feedback!

.txt should work fine aswell.

As long as it's the webserver is not only used for data saving they are fine with it....

I could understand why, I am not the server owner :)

However as I mentioned check my php script aswell you'd need to add that.

programtesting28 - January 15, 2015, 2:52 am

Oh I'm sorry. I didn't see it ?

Thanks

nathan72389 - January 15, 2015, 4:25 am

oh god, when will people stop using this same C&P code.

```
Code Private Function Hwid()  
    Dim myHwid As String = ""  
    Dim mc As New ManagementClass("win32_processor")  
    Dim moc As ManagementObjectCollection = mc.GetInstances()  
    For Each mo As ManagementObject In moc  
        If myHwid = "" Then  
            myHwid = mo.Properties("processorID").Value.ToString()  
        Exit For  
    End If  
Next  
Return myHwid  
End Function
```

Is there a different way of getting the HWID?

A ? ? ? ? ? - January 15, 2015, 6:40 am

(Jan 15, 2015 05:30 AM)Xghost7 Wrote: [\[CITE\]](#) Is there a different way of getting the HWID?

Was that a question ?? ?

Spoiler [\(Click to View\)](#)of course yes.

do people on here just not use their brain?

I know the only way op can come up with code is by copy and pasting, but you must be his brother. do you honestly think thats the only way to come up with a unique number for a pc?

stop relying on google and other people to give you code.

look.

take the username of the current user and then lets say maybe the sound card serial number, lets throw a hard drive serial number in there, and smash it all together with some random chr(#)+1 and holy fuck me sideways , you have something unique.

oh, ^^ this, if you use this, you have to give me credits. k, thx.

ps@ op. I see you still havent gotten past your shitty ways.

anyone can see in you "look at my new bullshit app" there was a suggestion to add a HWID check, or something. the code was even posted there for you.

its nice to see at least change a few variable names when you copy and paste code.

damn i know that mate, what i was searching is if there is an alternative way of getting the

procesor id -_-.

you made me laugh hard man: but you must be his brother

Shoot - January 15, 2015, 8:55 am

nathan is honestly retarded and all he does is flame, he looked at one piece of code not even the main code, you know what that means? he is a troll! omg ding ding ding correct!!!!

I've tried it in c# but failed horribly, it seems like it cannot be read by an 'external program' (a program not verified by microsoft)

But I believe it is with alot of pain in the ass...
