Thread: [Need help running a silent CMD command \(Shell is not working\)](#)

Mr Fox - January 23, 2015, 10:41 am

Alright I need when a button is pressed it runs the commands "start <application.exe> <IP> <Port>"

However I want it to run silently. When I try opening CMD and inputting the command, it goes through however it opens the window (I tried using taskkill afterwards but I would highly prefer it being 100% silent).

When I try using Shell it make the default directory system32 so when it runs the "start <Application.exe> <IP> <Port>" it cannot find the specified application.

Is there anyway to get shell to read from the current directory?

Zyklon A - January 23, 2015, 11:04 am

PHP Code

```
<?php
Dim processStartInfo As ProcessStartInfo = New ProcessStartInfo()
processStartInfo.FileName = "app.exe"
processStartInfo.Arguments = "/k <IP> <Port>"
processStartInfo.WindowStyle = ProcessWindowStyle.Hidden
processStartInfo.UseShellExecute = True
Process.Start(processStartInfo)
```

This should work!

```
<?php
Dim processStartInfo As ProcessStartInfo = New ProcessStartInfo()
processStartInfo.FileName = "app.exe"
processStartInfo.Arguments = "/k <IP> <Port>"
processStartInfo.WindowStyle = ProcessWindowStyle.Hidden
processStartInfo.UseShellExecute = True
Process.Start(processStartInfo)
```

This should work!

The application needs to be run with the Args. Or I'll get an error since once the application initializes it ignores the cmd args

Odus - January 23, 2015, 12:43 pm

Like this?

Code:

```
Code Dim p As New ProcessStartInfo("C:\Users\Odus\Desktop\VBConsole.exe", "hello") 'With
{.WindowStyle = ProcessWindowStyle.Hidden, .CreateNoWindow = True}
```

Process.Start(p)

Code:

```
Code Dim p As New ProcessStartInfo("C:\Users\Odus\Desktop\VBConsole.exe", "hello") 'With  
{.WindowStyle = ProcessWindowStyle.Hidden, .CreateNoWindow = True}
```

Process.Start(p)

instead of Code C:\Users\Odus\Desktop\VBConsole.exe

I need to have it in the files location

I need to have it in the files location

Replace with:

Code AppDomain.CurrentDomain.BaseDirectory & "whatever.exe"
