Thread: [Adding a VB theme to a .dll](#)

AspectModding - January 25, 2015, 3:37 am

Hello there HF, I am having a problem adding a vb theme to a .dll for a C# project, what I am doing is the following: I am creating a Class Library in VB adding the source from the theme to the class and trying to build it but I am getting over 200 errors, I tried it in a vb windows form and the theme works fine there. Can you please tell me what I am doing wrong please.

Nikey646 - January 25, 2015, 3:59 am

You will need to add references to at least System.Drawing and potentially System.Windows.Forms...A class library usually doesn't require either of those two References, so the template for Class Libraries does not include them.

I got those mate, any other ideas what I could of done wrong :D

Edit: I fixed it now thank you.

if you couldn't tell why you were getting 200+ errors you shouldn't be using custom controls.

The theme might needed Themebase... which must have added now by him/her as errors are resolved... ;)

According to ^, he did have System.Drawing/Windows.Forms referenced and it was something else.
