Thread: [Does anyone know how to activate a virus on the next computer startup?](#)

KuKomPU - January 25, 2015, 12:22 pm

Okay so I've written this little virus script, but I was thinking; if I walk up to a computer, plugged a USB into a computer and then run the virus, people would see the computer which I walked away from all messed up, therefore giving away that I did it and I would get caught.

So how do I set up a script so it auto executes on the next startup or something? I know I can just RAT the computer as well, plant the script somewhere on the PC, then remotely launch the virus. But that's not really what I want to do.

Thanks in advance guys :)

You can put the virus in the startup folder so that it executes on boot.

I wouldn't need to have admin tho right?

That's called rootkit there are some methods for that or you can put it directly to startup folder:D

I cannot link because of HF rules but type m247 to Google and it will show

I cannot link because of HF rules but type m247 to Google and it will show No, a rootkit is something that hides a process or program(s) from being detected and maintains root access.

You could do task schedule which you pick the time and date it starts. Hopes this helps a little and good luck!
