Zinedine Zidane - January 31, 2015, 11:20 am

Hello HF, I think you know the Joomla Method ?

this method exploit a XSS vulnerabilty on the Google MAP Plugin in Joomla Websites

I coded a Joomla Scanner + Filter + Attack Panel in C# for Windows Noobies user ^^

Update Logs

v1.0 : Simple Scanner

v1.1 : Threaded Scanner

v1.2 : Filter Added

V1.3 : Attack Panel Added

ScreenShots

How to get the Tool ?

Download Link : <https://www.mediafire.com/?q56w4bd6gun83e4>

Virus Scan :

<https://www.metascan-online.com/en/scanresult/file/9a73ad1034204dfcb0fe0beef4a7a635>

Please Note : I'm searching a C# Coder able to make a fucking Repeat Loop to browse the textbox in the Attack Panel because I tried the repeat: goto repeat; but the tool bug and freez

Here the tool browse the Textbox and just send one time

For instance If I have 5 Links there is only 5 packets 5 then I want it make a Loop while the Stop Button is not pressed

Anyway PM me

DerekM - January 31, 2015, 12:19 pm

I'm pretty impressed with this scanner, took about 2 minutes to find 50 working plugins.

Much faster than scanning the entire internet it seems.

I'm also impressed with however you are scraping Google results, with dorks, without being labeled a bot.

I watched this scanner with a packet sniffer and it's not using proxies or anything to hide, +1.

Whatever method you are using to avoid Google's smart bot detection, keep it up.

Google is the largest scraper in the world but they say we can't scrape their data?

Thanks

This is probably the best thing for joomla since joomla.

DerekM - January 31, 2015, 4:47 pm

Final lists do need to be checked/filtered.

I would create another socket within the scan app and have it check the list while the other socket is scanning.

If it "bug and freeze" it's because you're looping on the main/GUI thread i think, then you need as VS 2010 (for sure) or over gives, a background worker or else a simple thread. the background worker is much easier to use, (i prefer a simple thread define much more) this will do a loop on anther thread than you GUI and this will prevent from freezes and you'll can interact with the gui then the STOP button can respond correctly. Also you need to uses delegates to access the main thread with another thread, else it will pop an error, crash or something else (depends on the program in fact) then you'll be OP, hope i've helped ;) Good Luck
